

Is evolution a driver or passenger of biological invasions?

Ruth Hufbauer

Colorado State University

Fort Collins, CO

Evolution as a driver

- Adaptation

- Range expansion dynamics

Megan Vahsen

Marianna Szűcs

Range Expansion:
Evolution with
and without
spatial structure

Brett Melbourne

Topher Weiss-Lehman

Adaptation:
Evolution in a
novel habitat
vs. **no evolution**

Adaptation as a driver

- Does response to selection lead to
 - higher densities?
 - faster spread?

Adaptation as a driver

- Selection in a novel habitat
 - Higher growth rate
 - Higher carrying capacity

- Expansion speed $\approx 2\sqrt{rD}$ (Fisher 1937)

growth rate

mean dispersal
distance (diffusion)

The model system

fresh media

Non-Evolving

Non-Evolving

Non-Evolving

Non-Evolving

fresh media

Non-Evolving

Non-Evolving

From large colony on wheat flour
minimal drift
minimal inbreeding
no adaptation to corn

Data

- 6 generations of censuses
 - # of individuals by patch in a landscape
- “common garden” experiment
 - growth rate of evolving and non-evolving in novel environment
 - dispersal from low and higher density patches

capacity)

Generation

Adaptation as a driver

- Selection a novel habitat

- Higher growth rate ✓

- Higher carrying capacity ✓

- Expansion speed $\approx 2\sqrt{rD}$ (Fisher 1937)

growth rate

positive density ✓
dependent dispersal

Evolution as a driver

- Adaptation

- Range expansion dynamics

Evolution as a driver

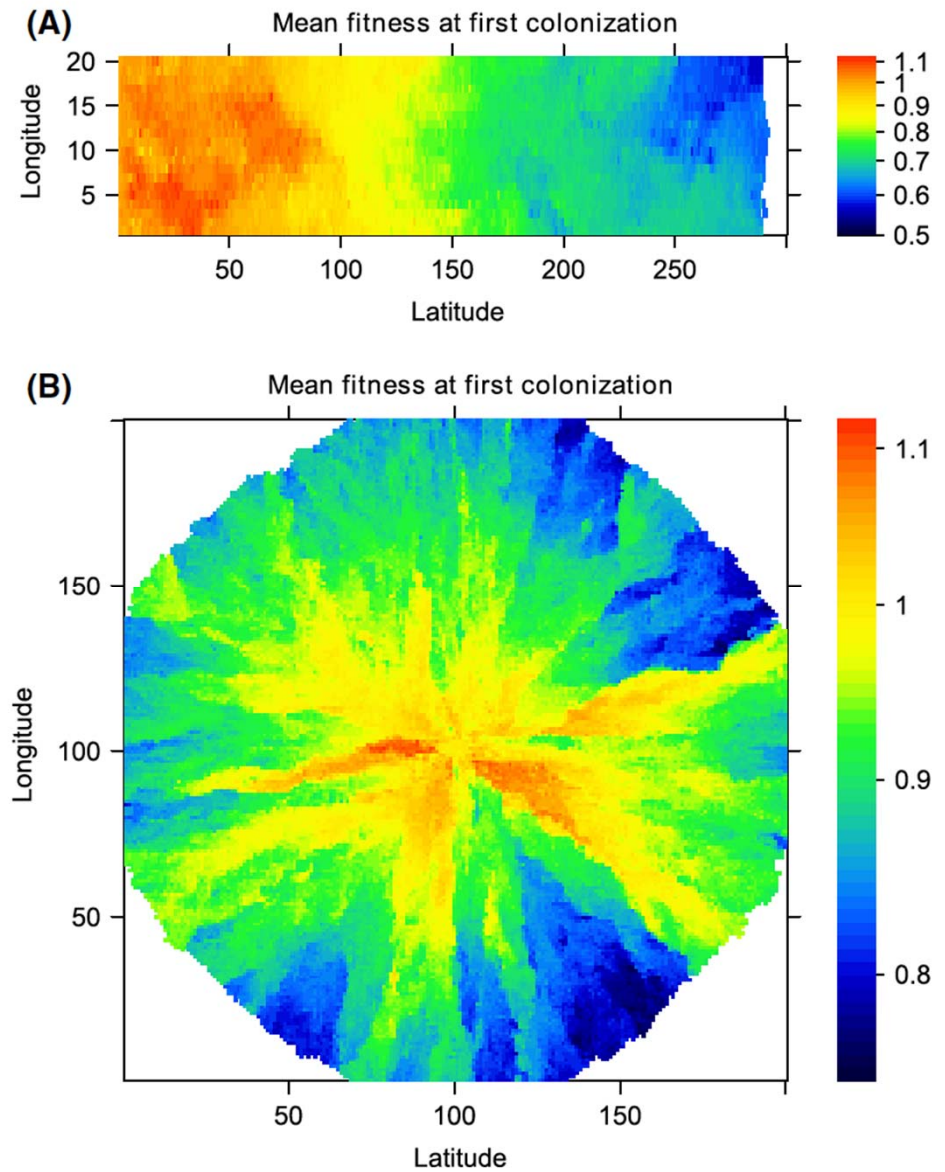

- Evolution across a range expansion
 - Evolution of growth rate differences from core to edge
 - Higher dispersal rate

Ben Phillips, Rick Shine

surfing of deleterious alleles at the expansion front

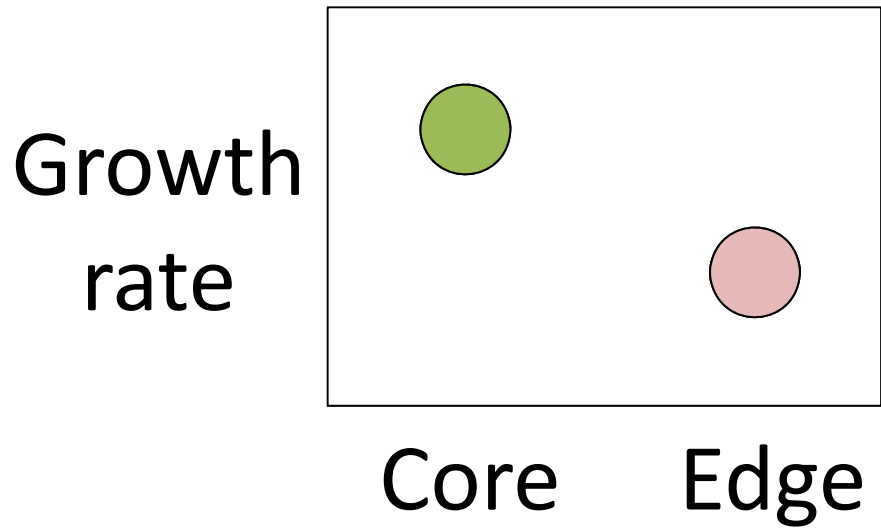

Contrasting predictions

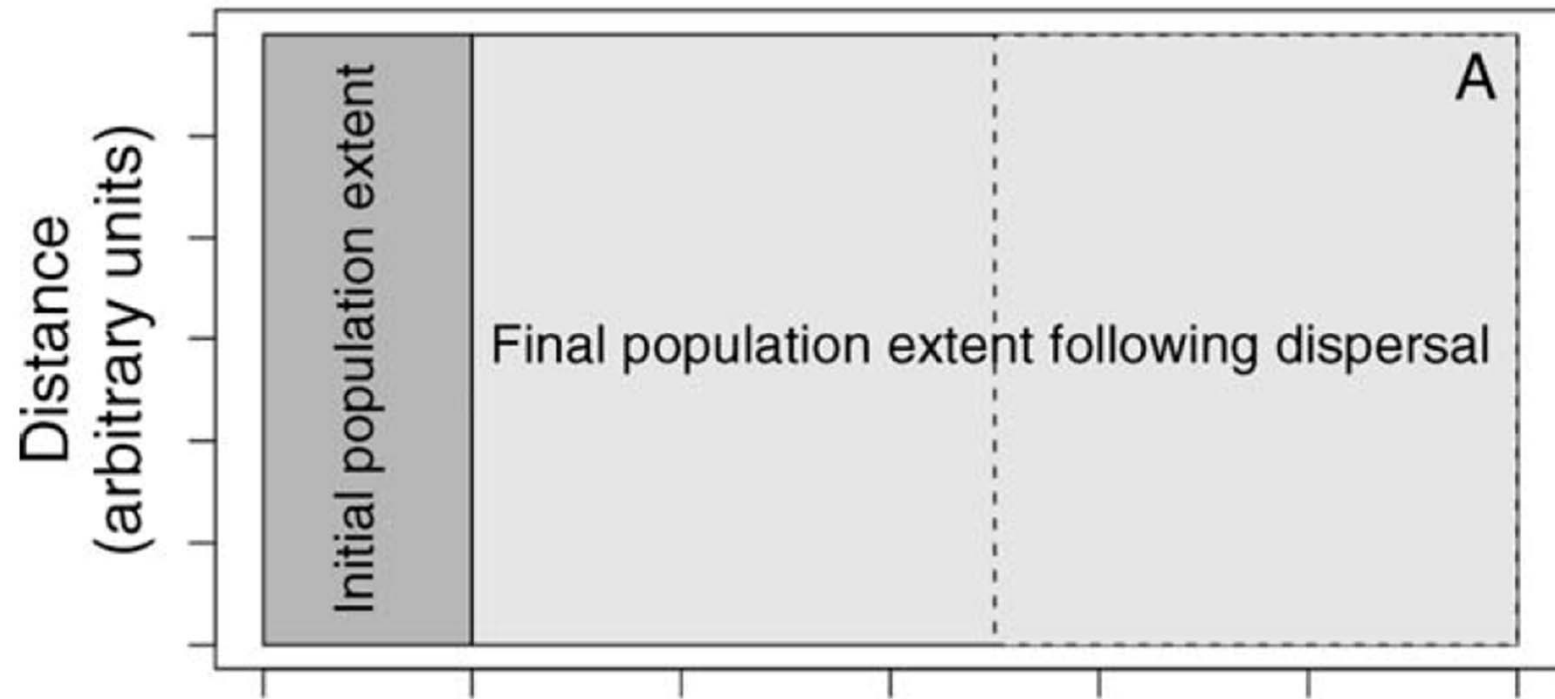

Phillips and co:
density-driven selection

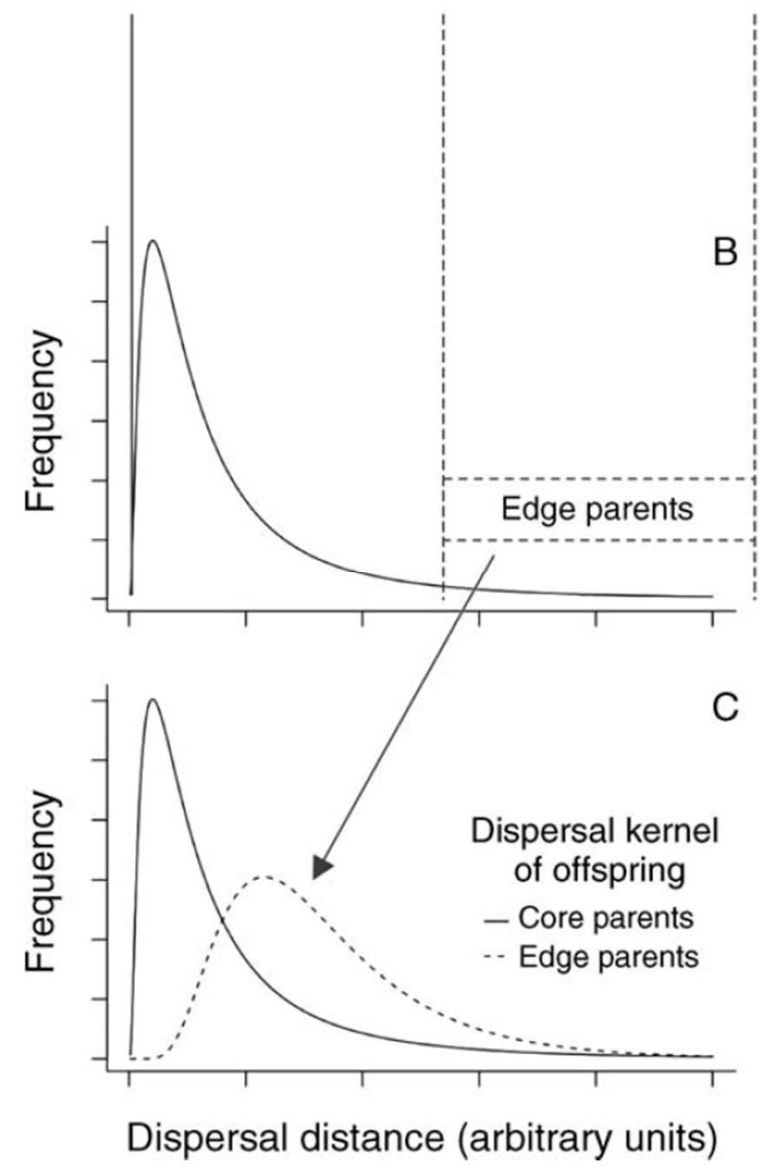

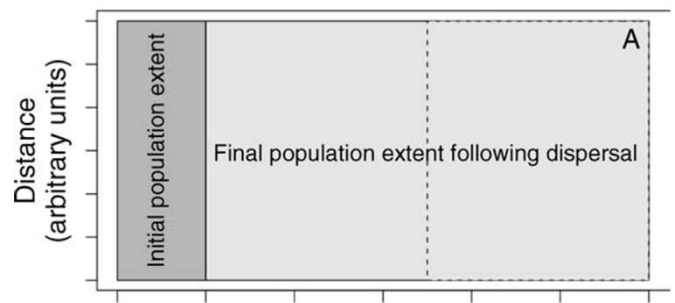

Peischl and co
gene surfing/expansion load

Dispersal

Phillips and co:
spatial selection for dispersal

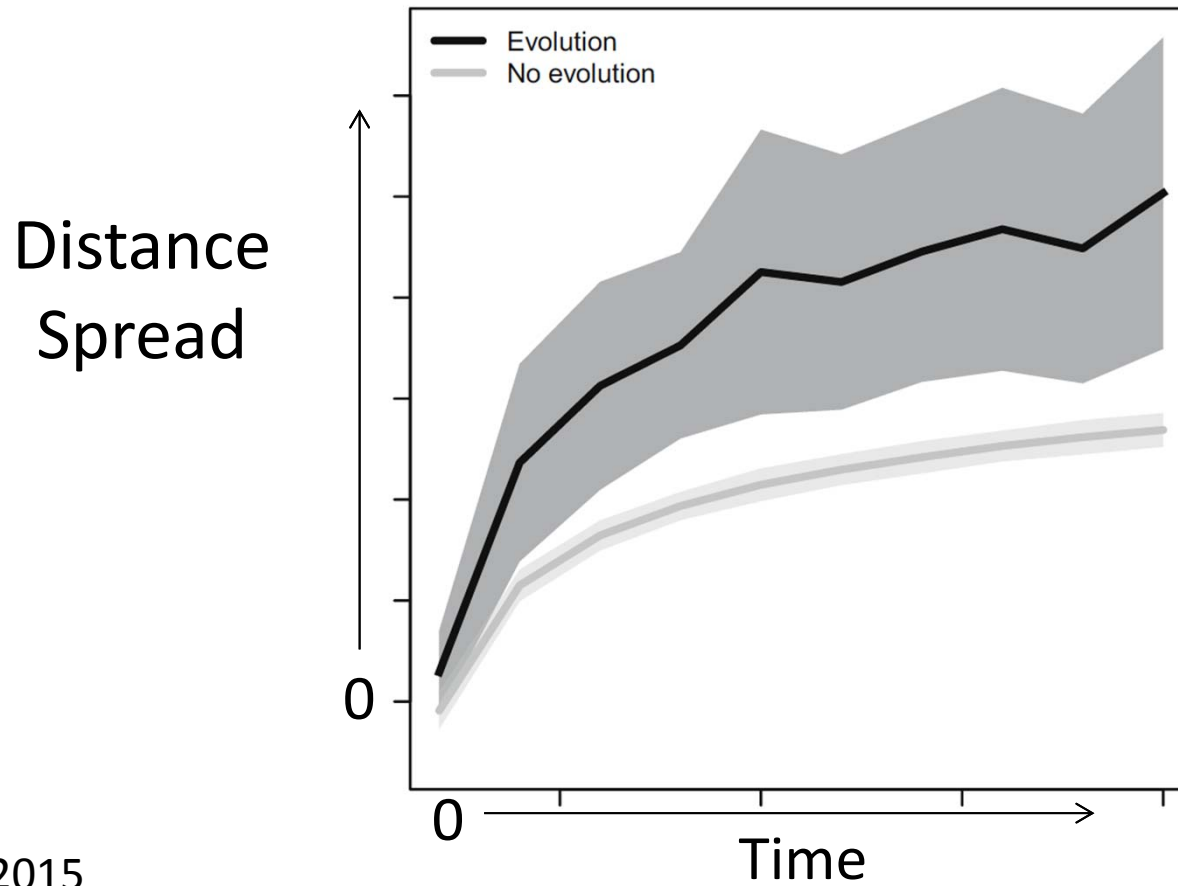

Dispersal

Core

Edge

Expansion distance and predictability

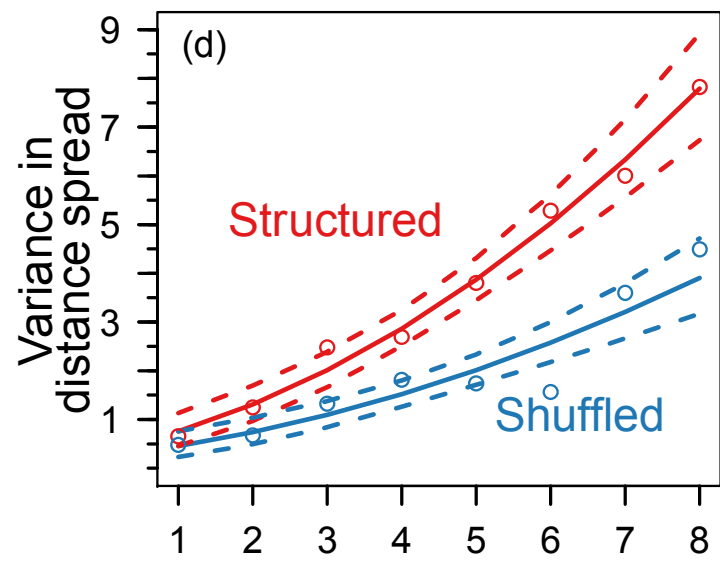

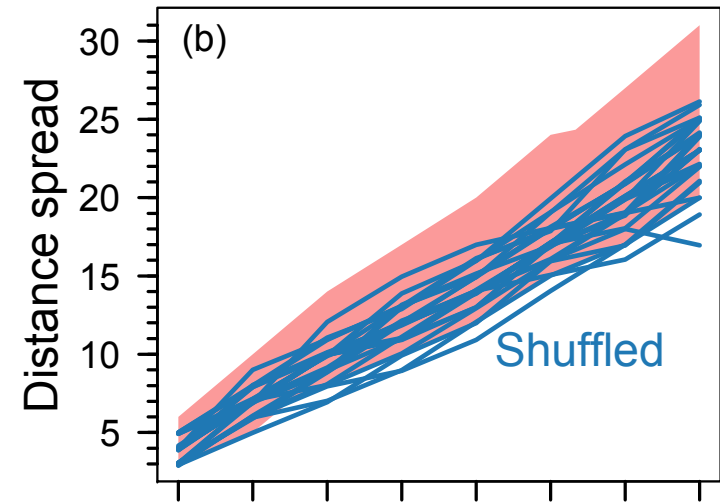

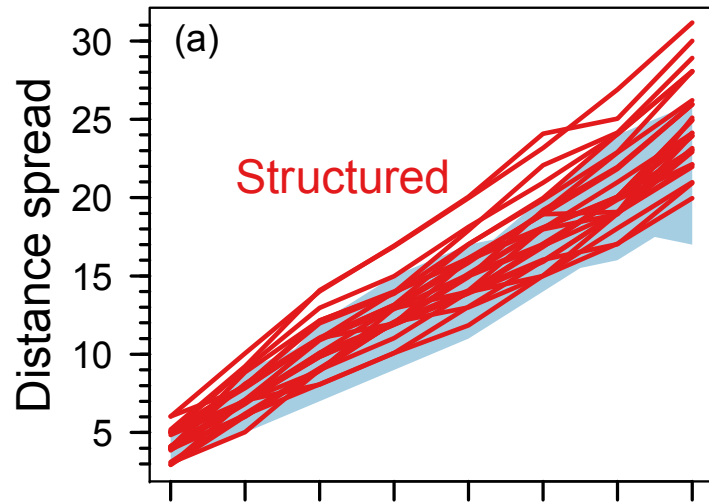

Spread experiment

- No novel habitat
- Structured
 - evolving normally with spatial structure
- Shuffled each generation
 - no evolution of spatial structure
 - demographic structure maintained

Evolution as a driver

- Adaptation

- Range expansion dynamics

What next?

- First experiment – have beetles from core, edge and non-evolving frozen (~30) (but no \$\$)
- Second experiment – have pool seq data (20 beetles)
 - 22 structured (founders, core & edge at gen 8)
 - 15 shuffled landscapes (founders, gen 8)

What next?

- Can we detect signals of adaptation or gene surfing in genomic data?
- Is that even an interesting question to ask??
