

Attack of the clones

The introduced willow sawfly *Nematus oligospilus* in Australia

Dr Valerie Caron
CSIRO - Health and Biosecurity

Outline

- Willows
- Willow sawfly
 - Native plants
 - Distribution
 - Population genetics
 - Invertebrate community
- Conclusions

Invasive organisms

- Have major negative impacts in their new environments
 - Species diversity and abundance
 - Native communities
 - Ecosystem processes
 - e.g. fire regime

Willows

- Salicaceae - *Salix* sp.
 - Subgenera: *Vetrix* and *Salix*
- No native willows in Australasia
- 32 taxa naturalised
- Invasive in streams and wetlands

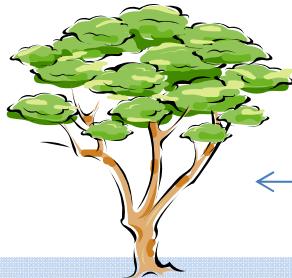

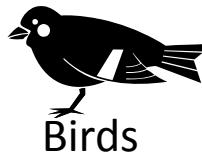

In-stream

Riparian zone

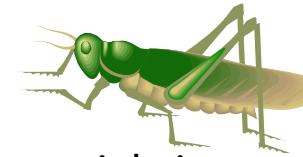

Riparian vegetation

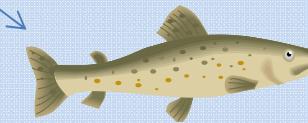

Aquatic
invertebrates

Birds

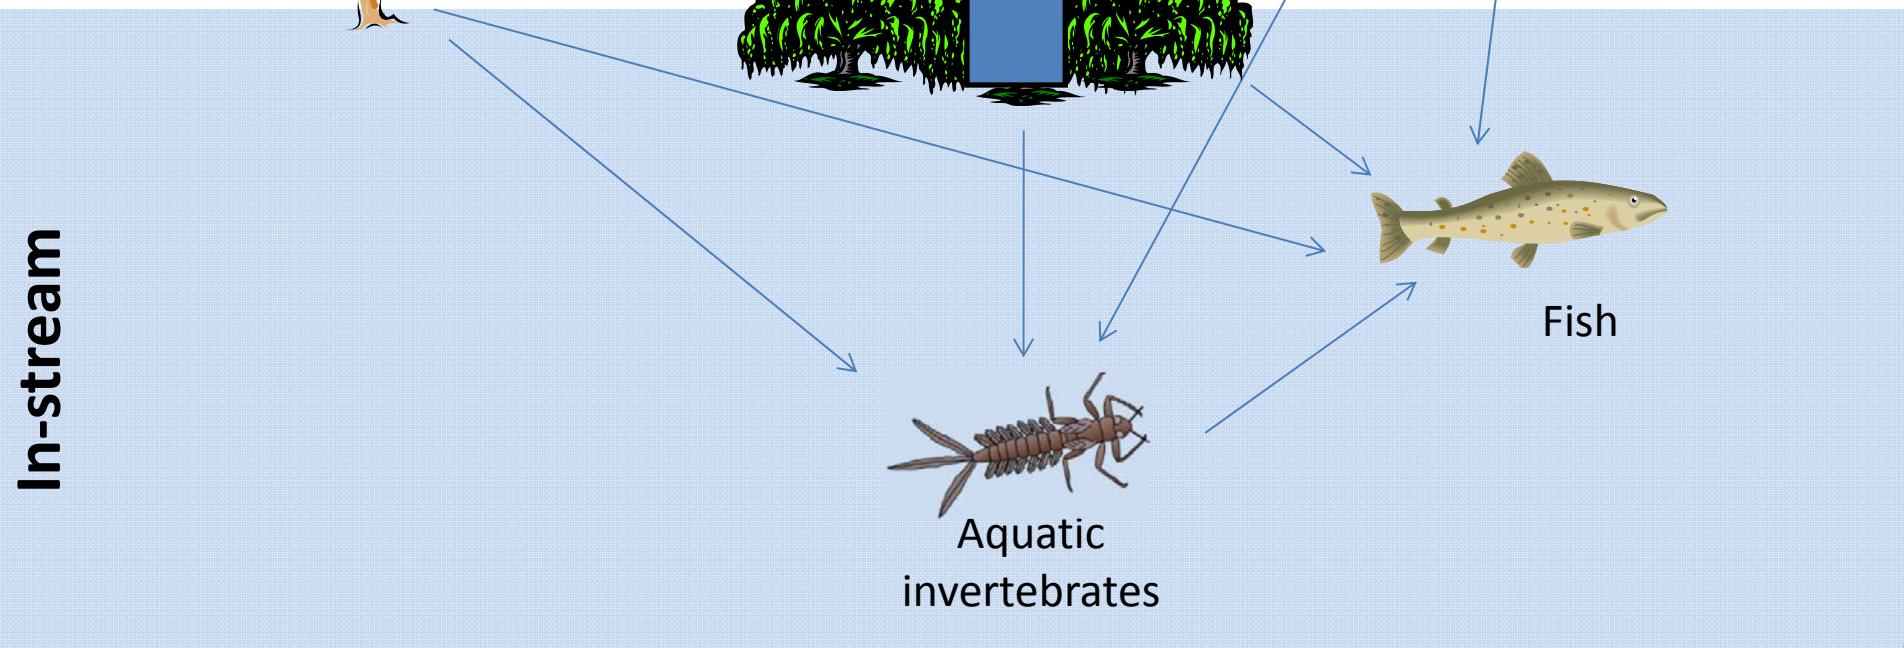

Terrestrial invertebrates

Fish

Riparian zone

Benefits

- Erosion control
- Ornamental
- Shelterbelt
- Fodder
- Apiculture
- Cricket bat
- Basket making

Australia

- Weed of National Significance
- Willow enthusiasts don't agree
- Large control program

New Zealand

- Positive for erosion control
 - Breeding program/ planting
- Two taxa are significant pests

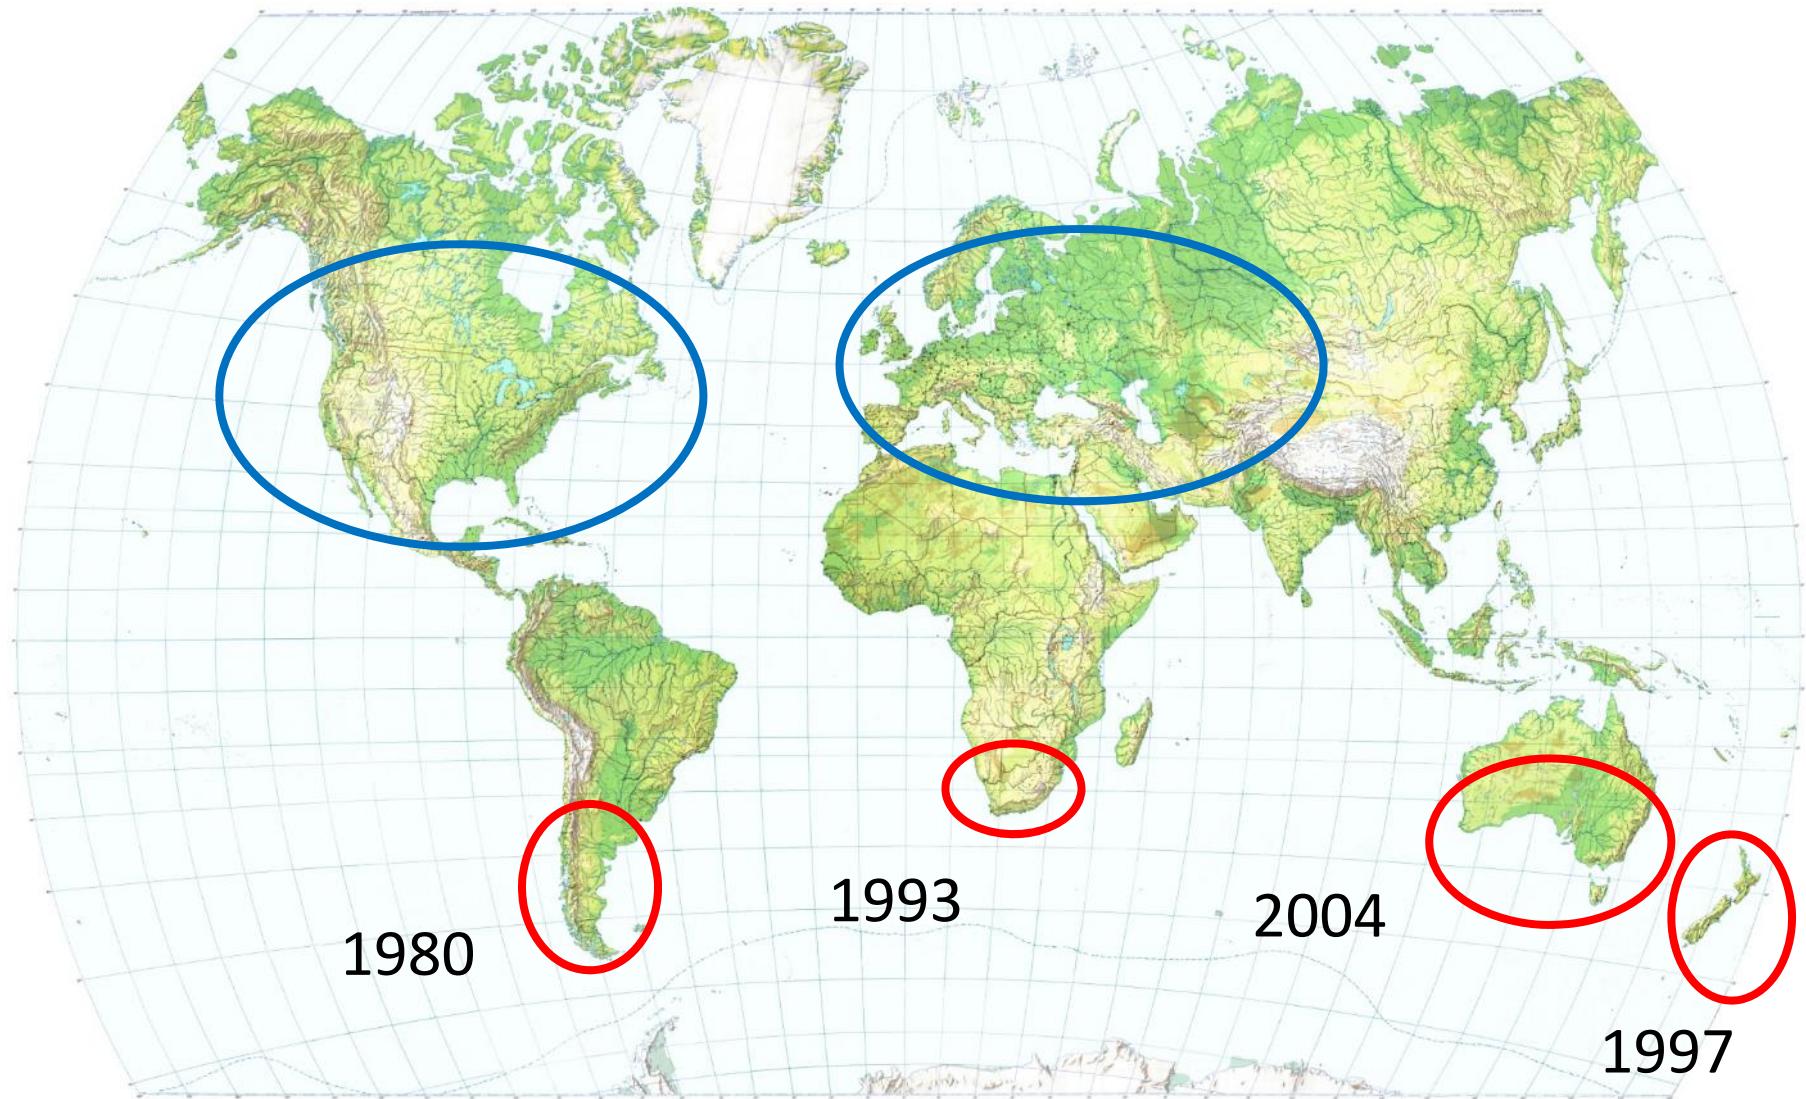

Willow sawfly

- *Nematus oligospilus*
(Hymenoptera:Tenthredinidae)
- Introduced to Australia - 2004
- Spread rapidly

Willow sawfly

- Native to Europe and North America

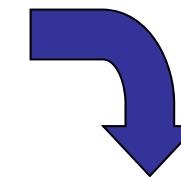

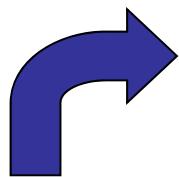

Willow sawfly

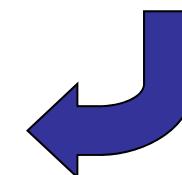

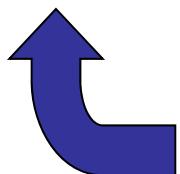

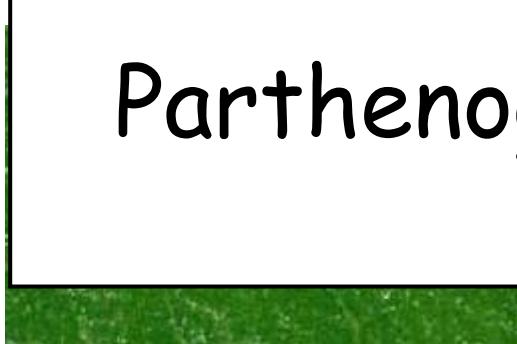

- Native to Europe and North America
- Complex taxonomy
 - Group of species?

Schmidt and Smith 2009

Lifecycle

Parthenogenetic in invasive range

Defoliation

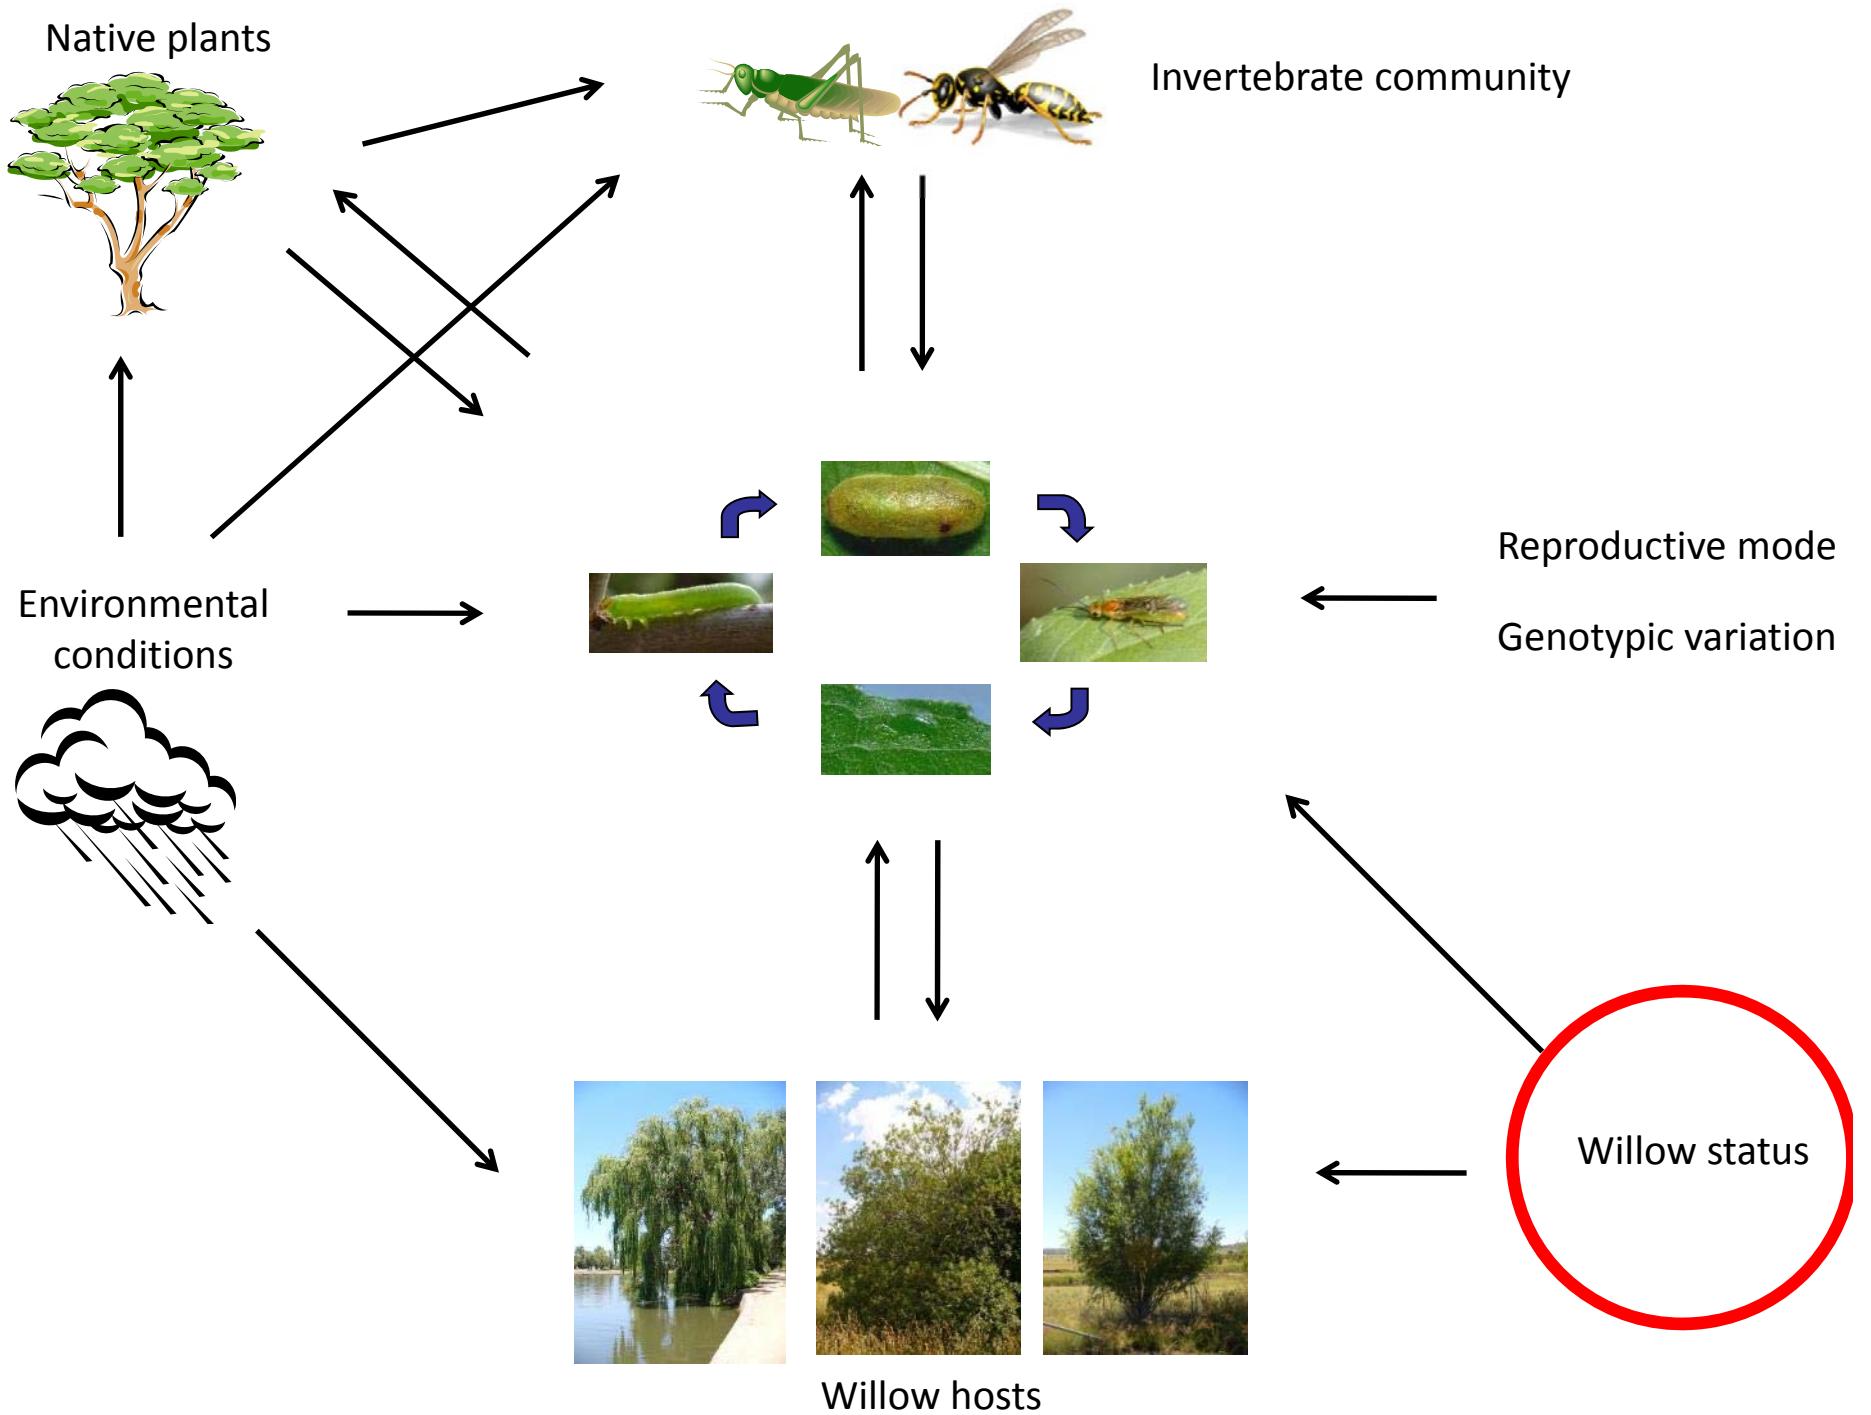

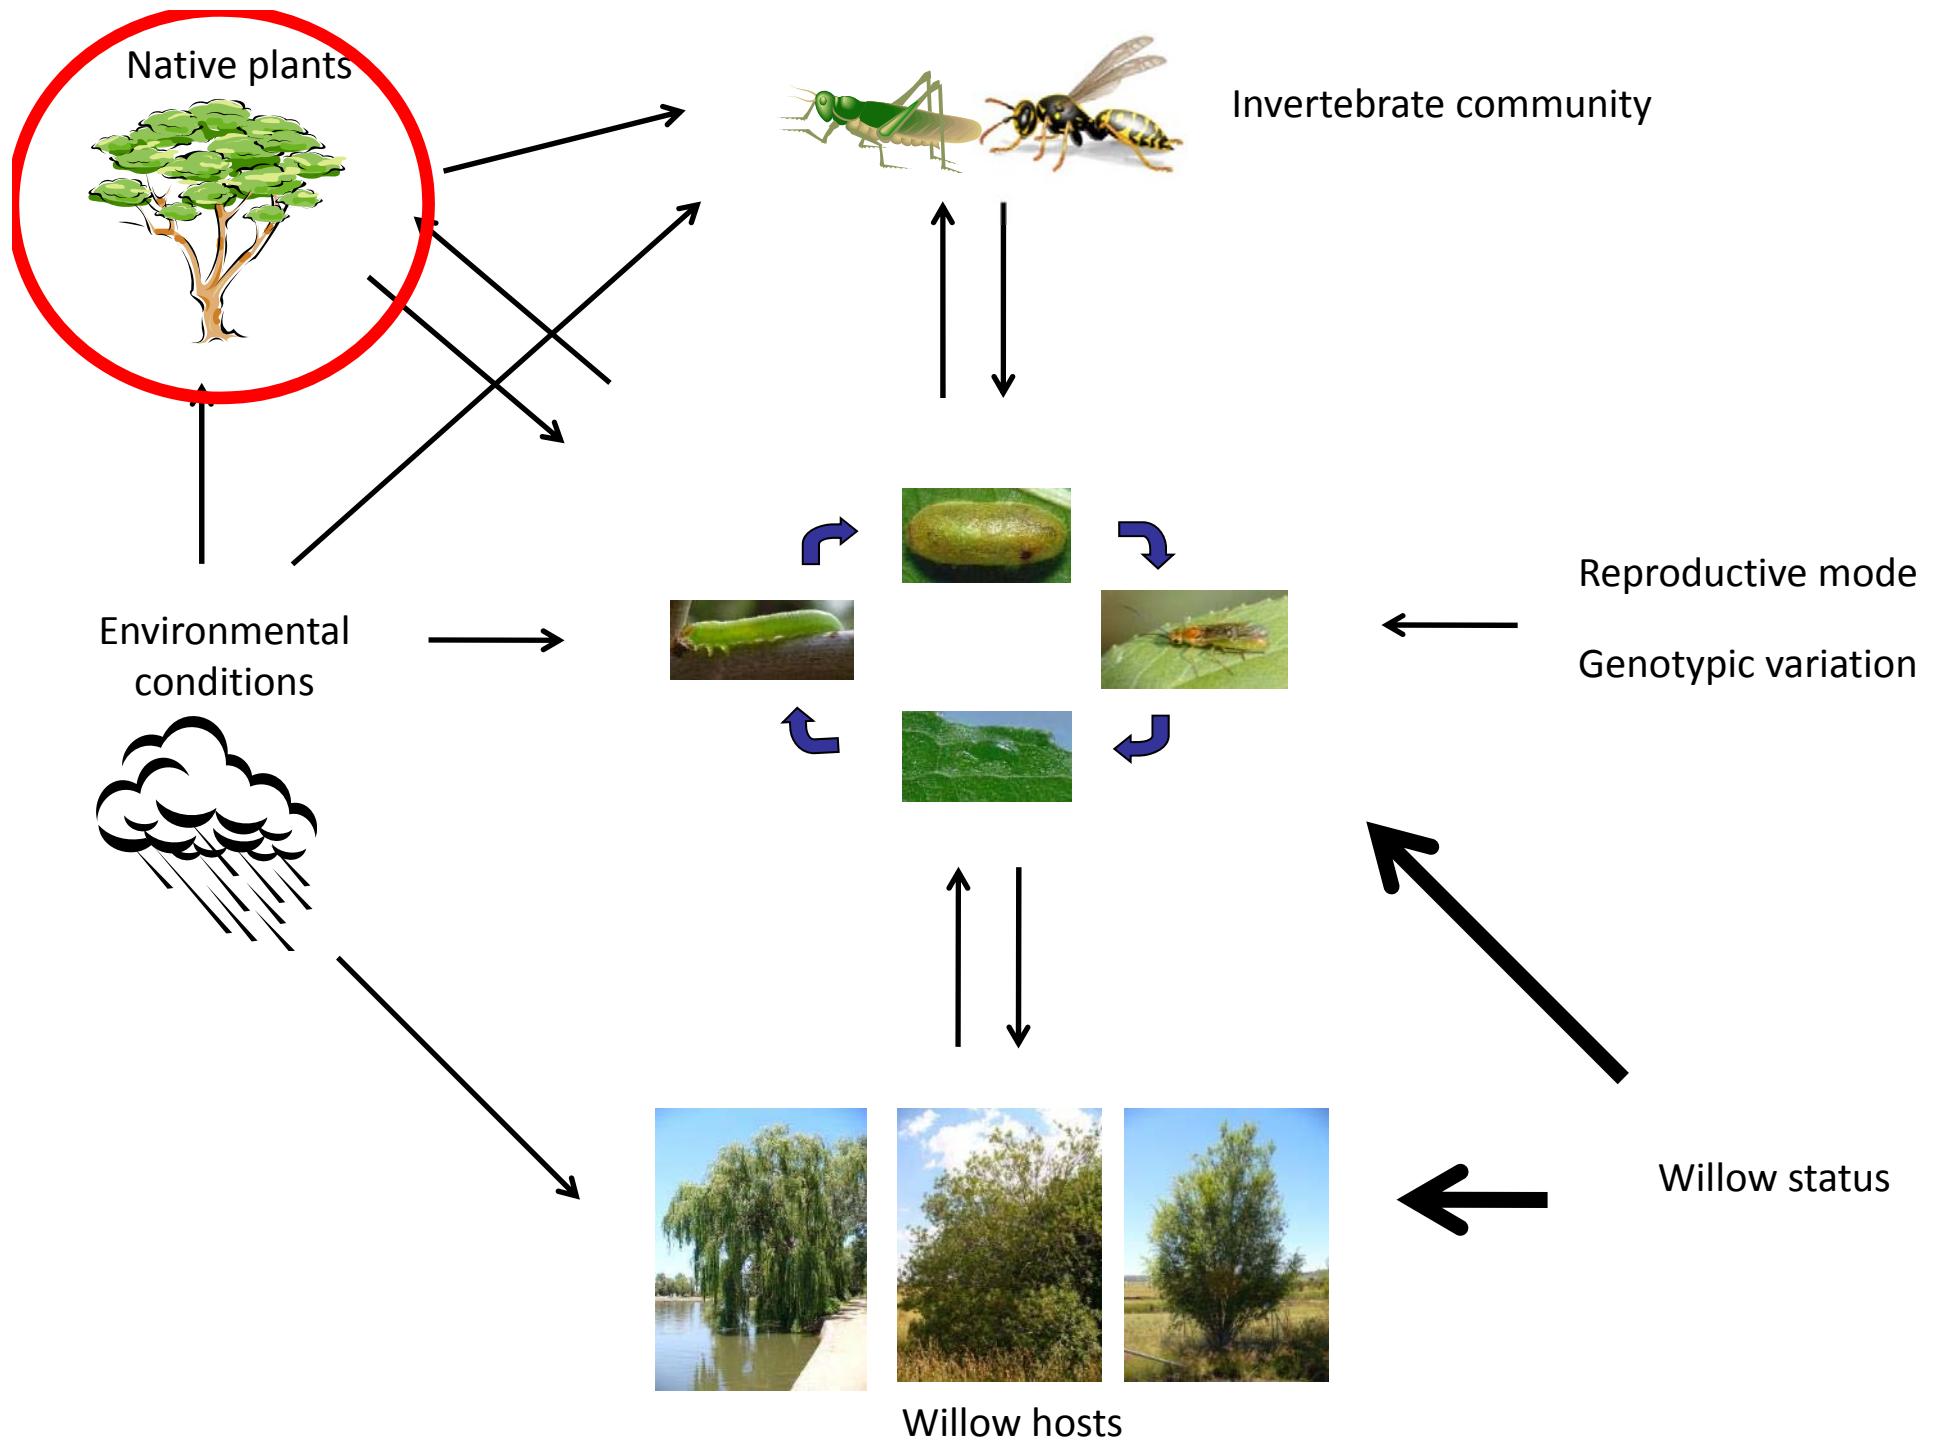

Die-back

1. Native plants

Aims

1. Assess *N. oligospilus* host range
2. Determine potential impact on native plants

Methods

Host-specificity testing

- Non choice feeding trial
- Oviposition

35 plant species tested

1. Closely related
2. Same habitat
3. Ecologically important native plants
4. Economically important exotic plants

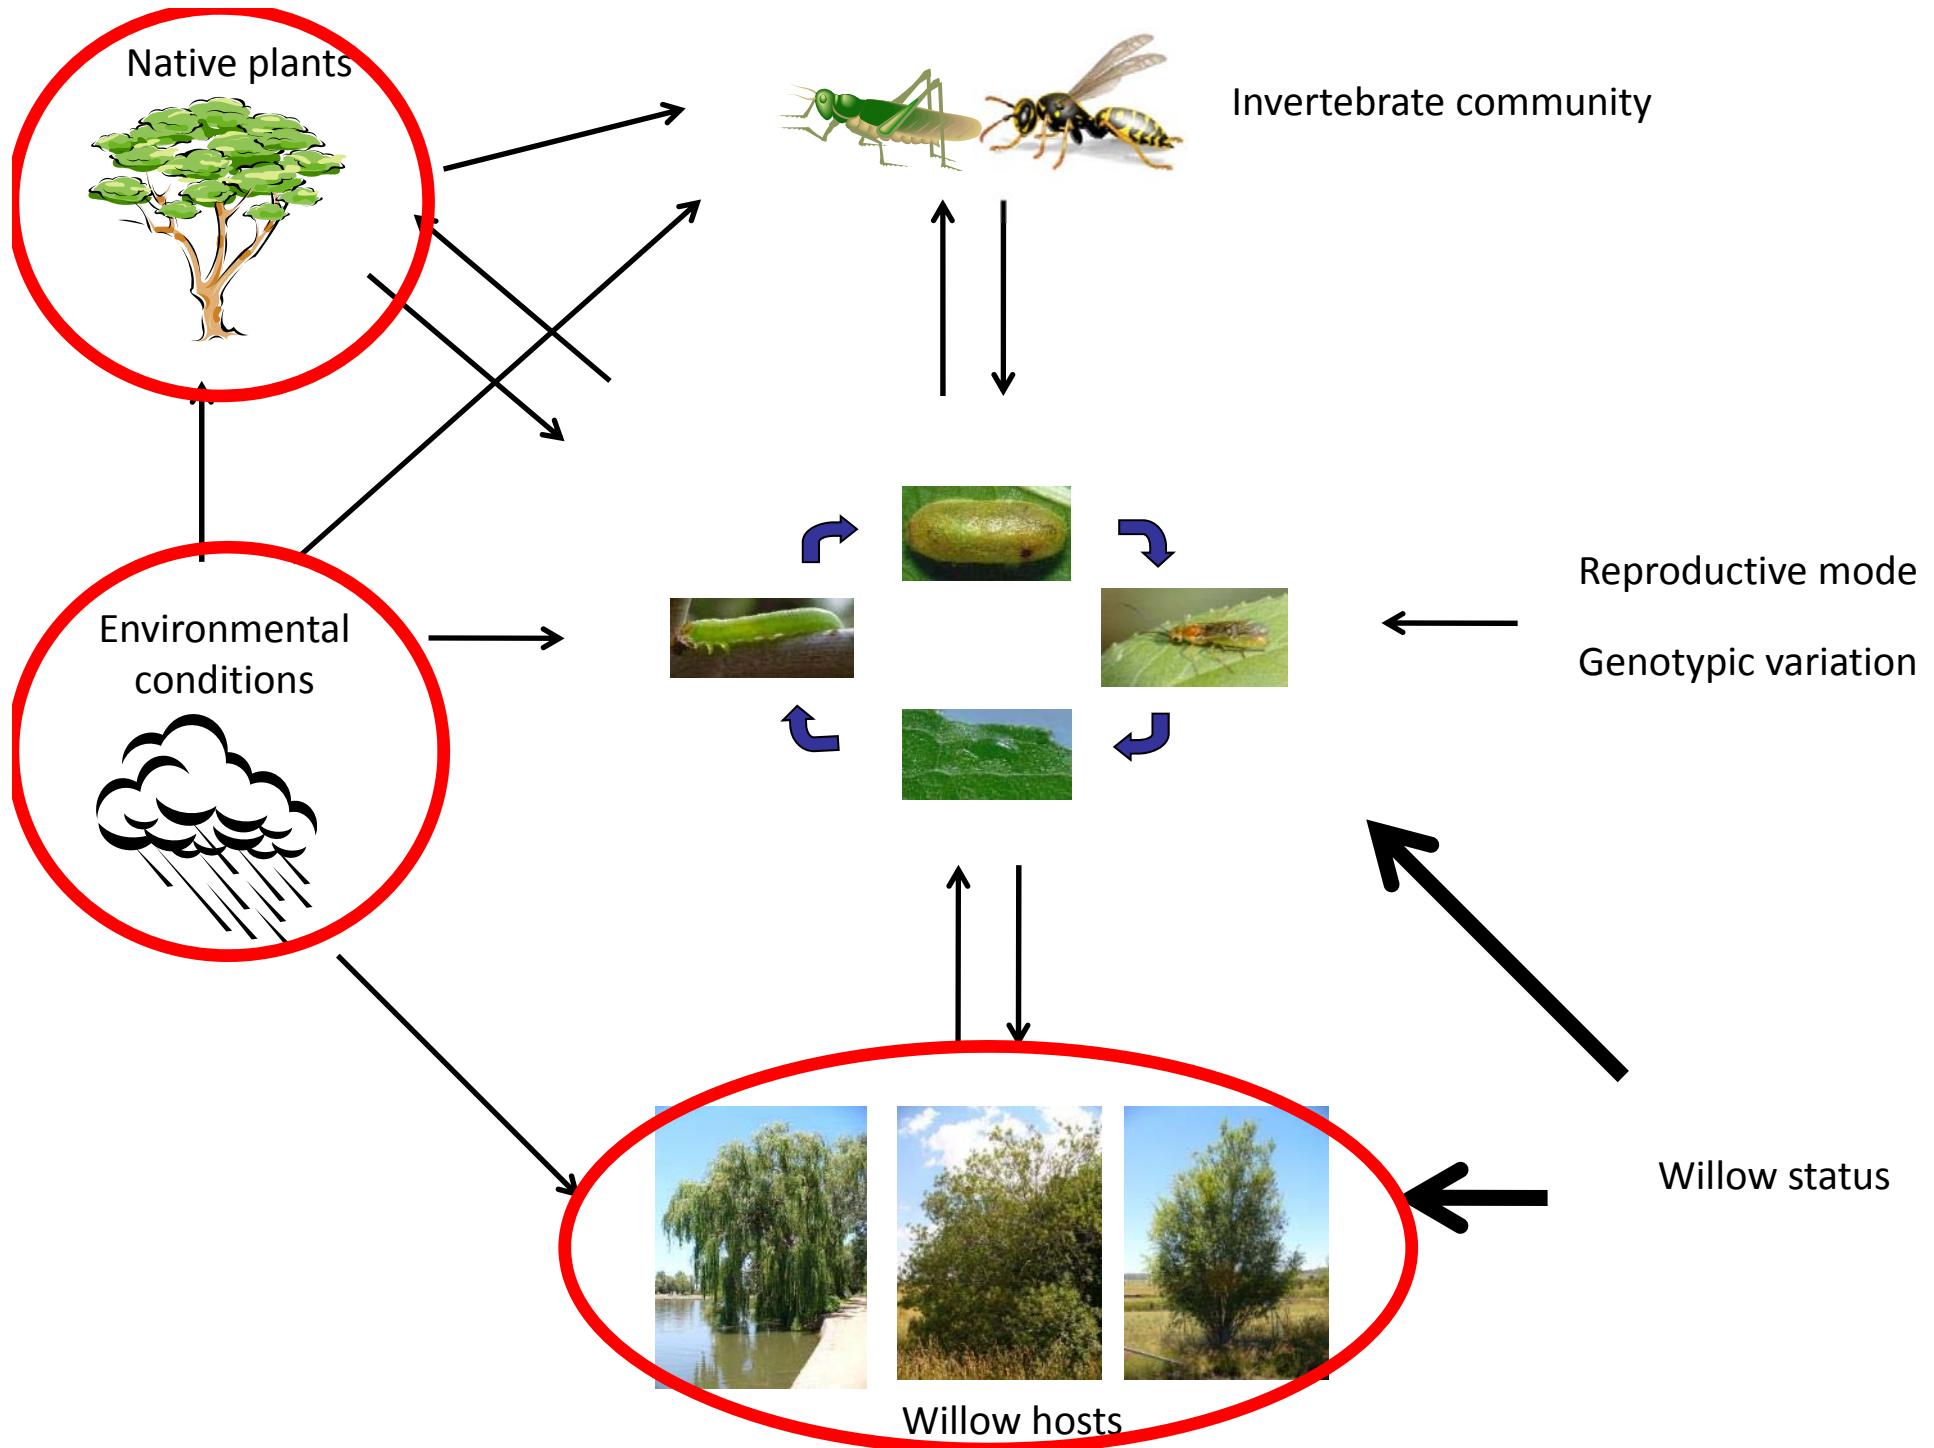

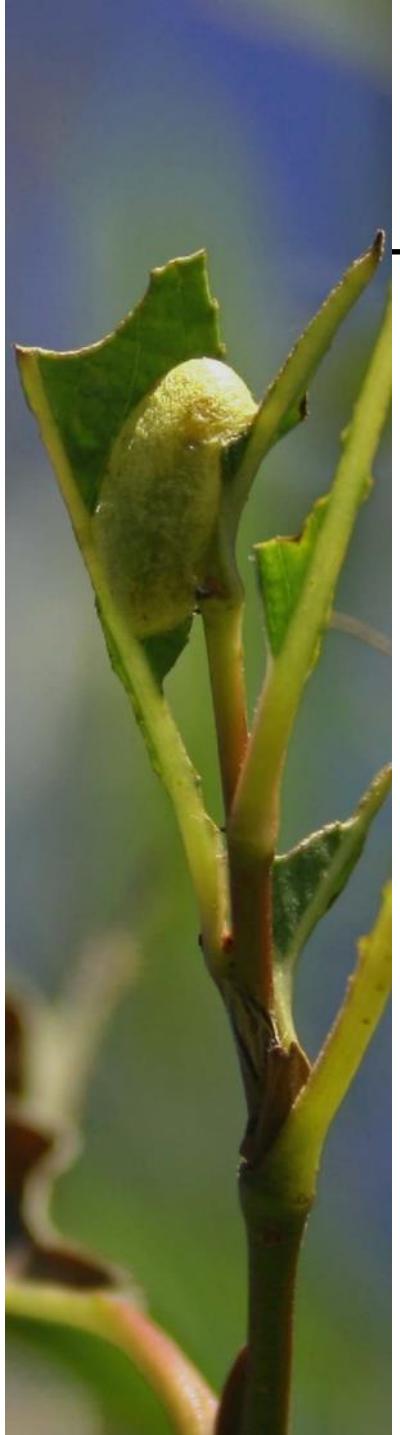

Results

Willows only:

- Extensive feeding damage
- Survival to adulthood
- Oviposition

Specific to willow spp.

2-Environment/willows

Aims

1. Distribution / expansion
2. Climatic preference
3. Host preference

Field collection

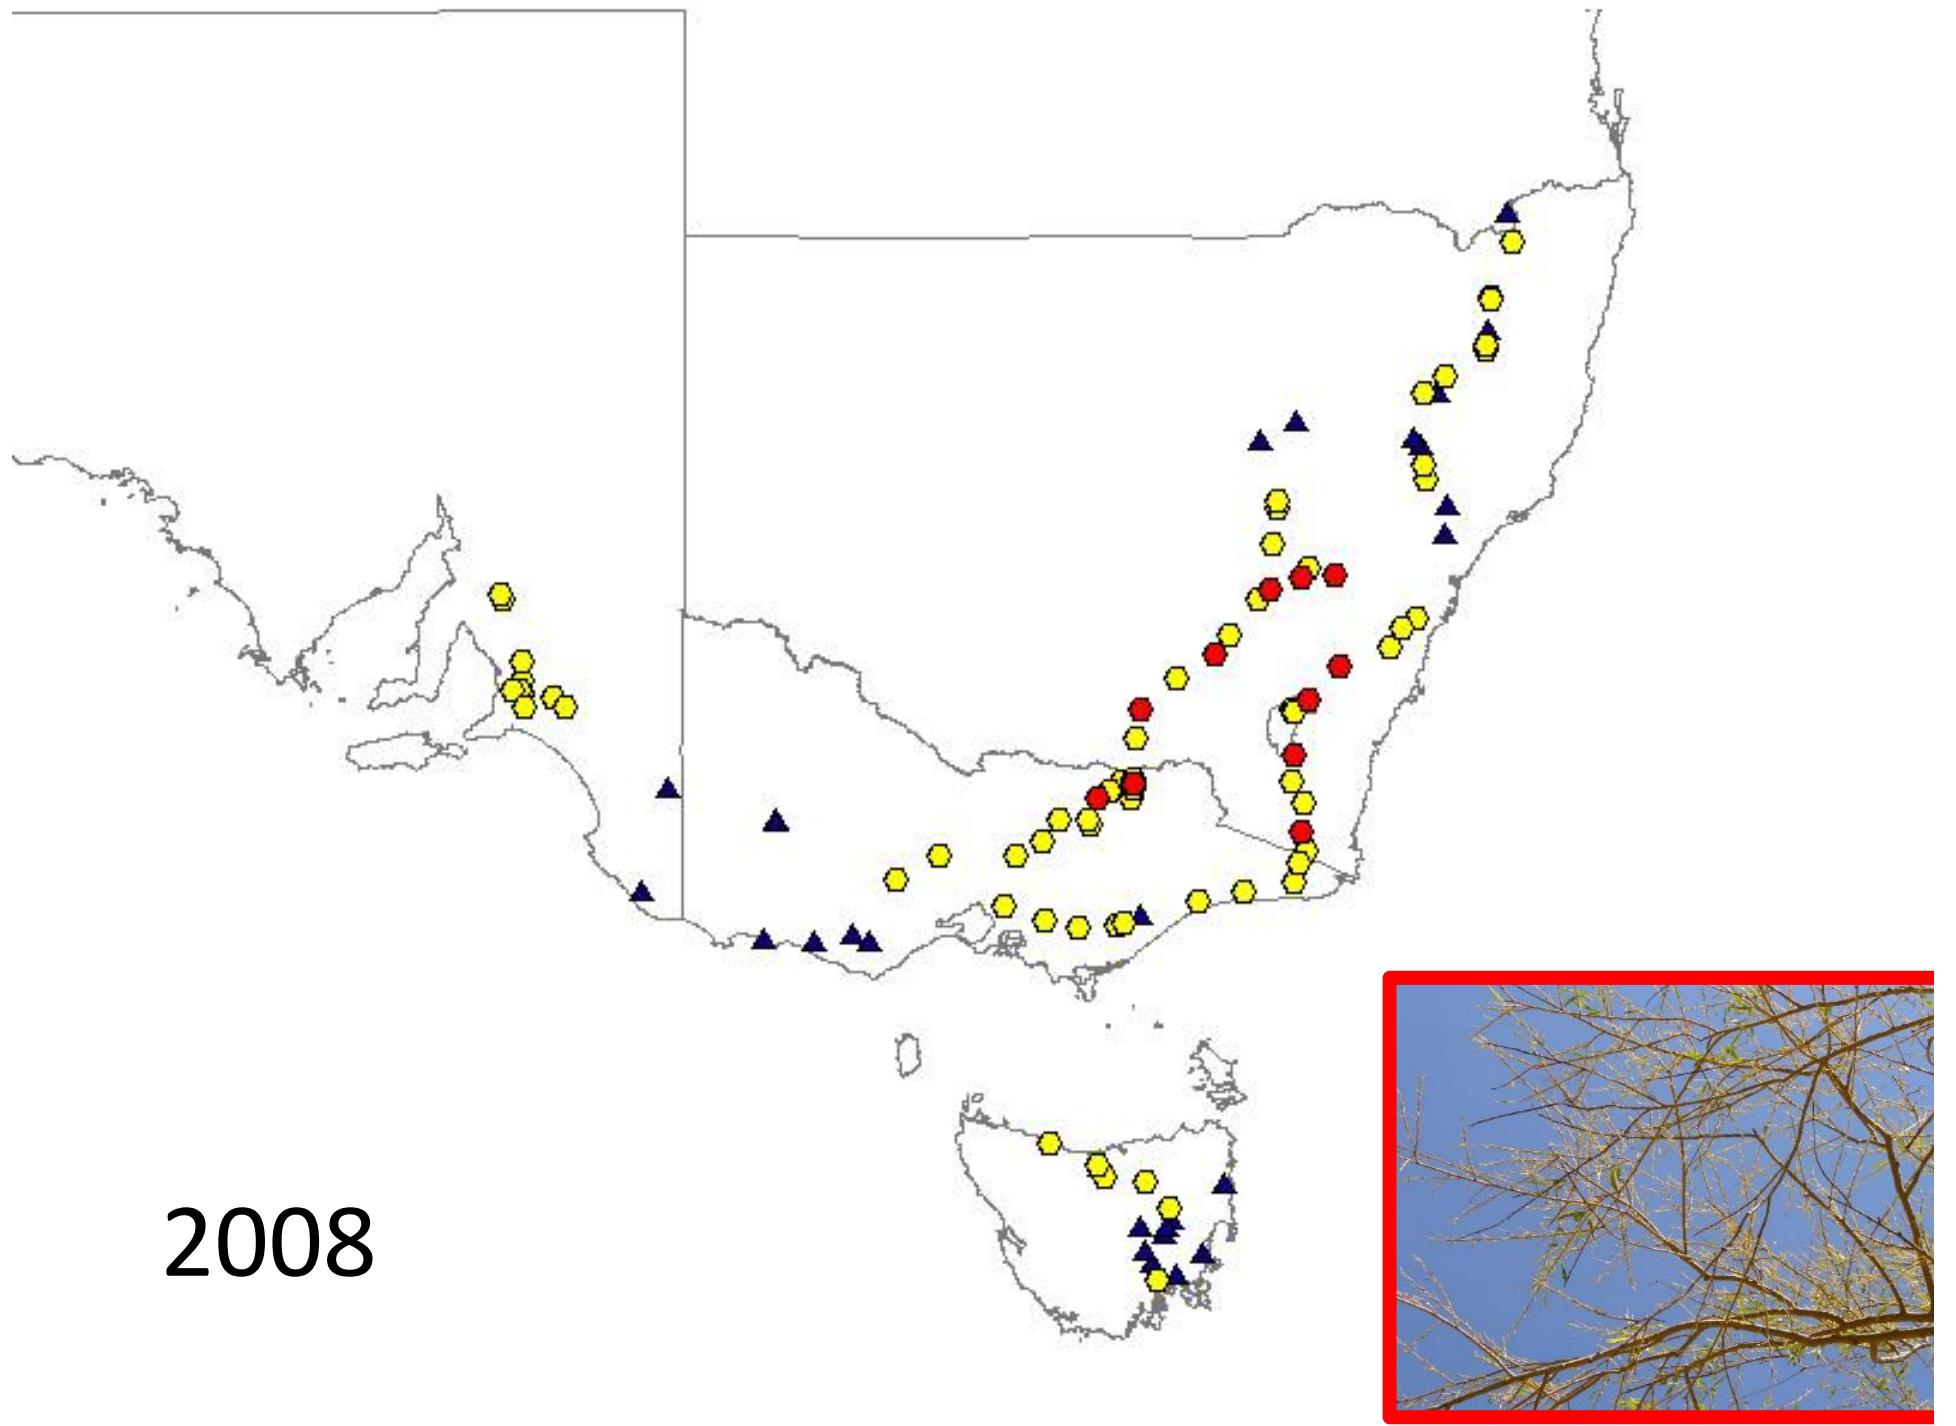

- Australia (> 100 sites)
 - Vic, SA, NSW, Tas, Qld (2008/2009)
 - WA (2010)
- New Zealand (22 sites) (2009)
 - Assess visually
 - Willow taxa
 - Population density

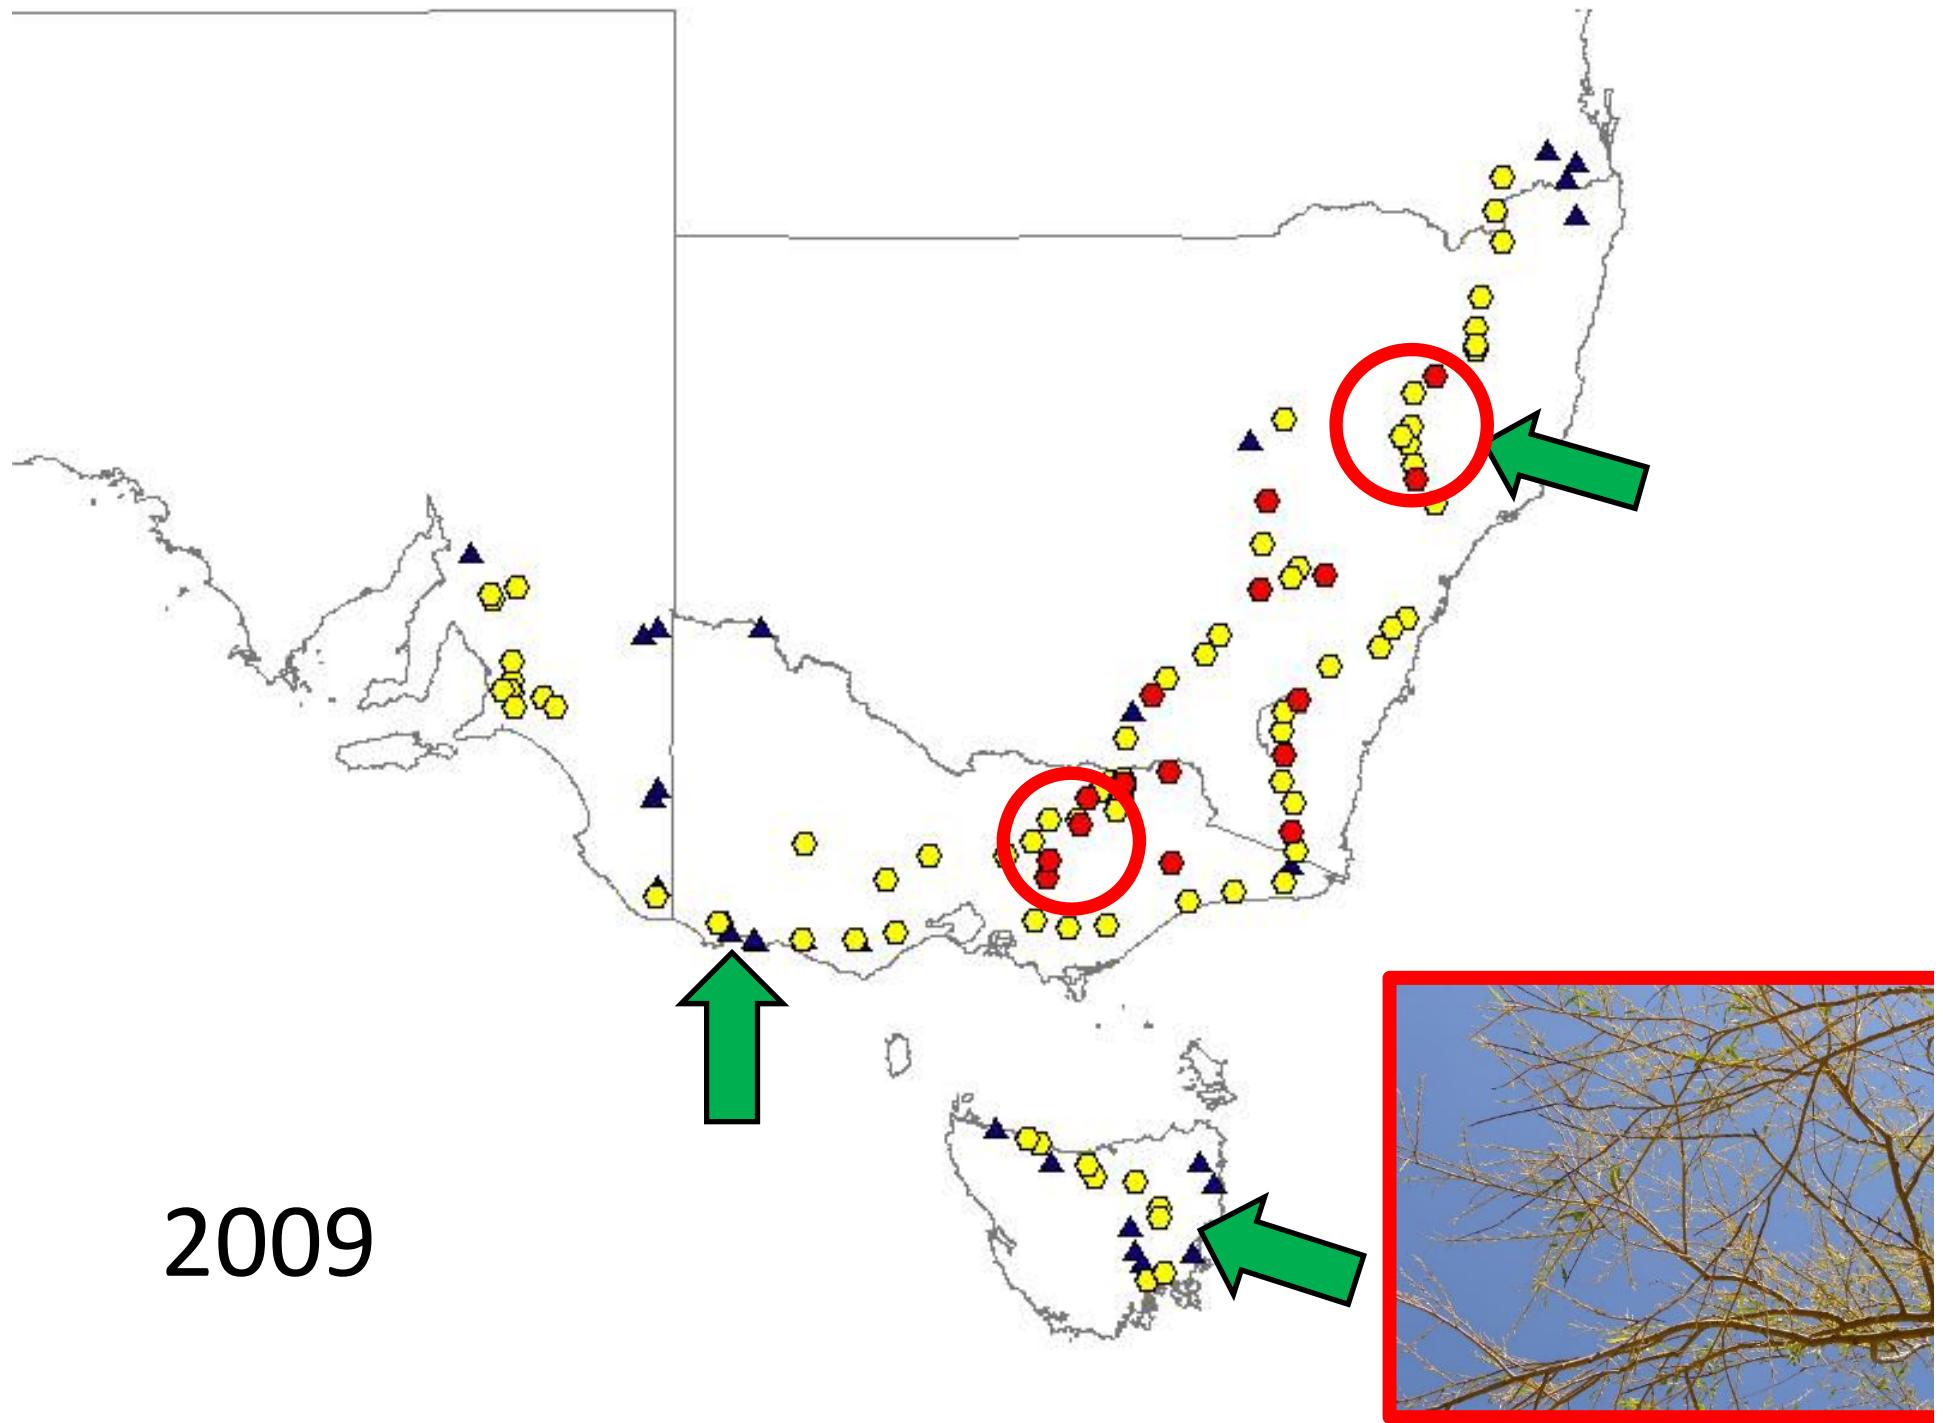

Results

- Widespread
- Temperate areas
- Still expanding in Australia
 - Patchy distribution

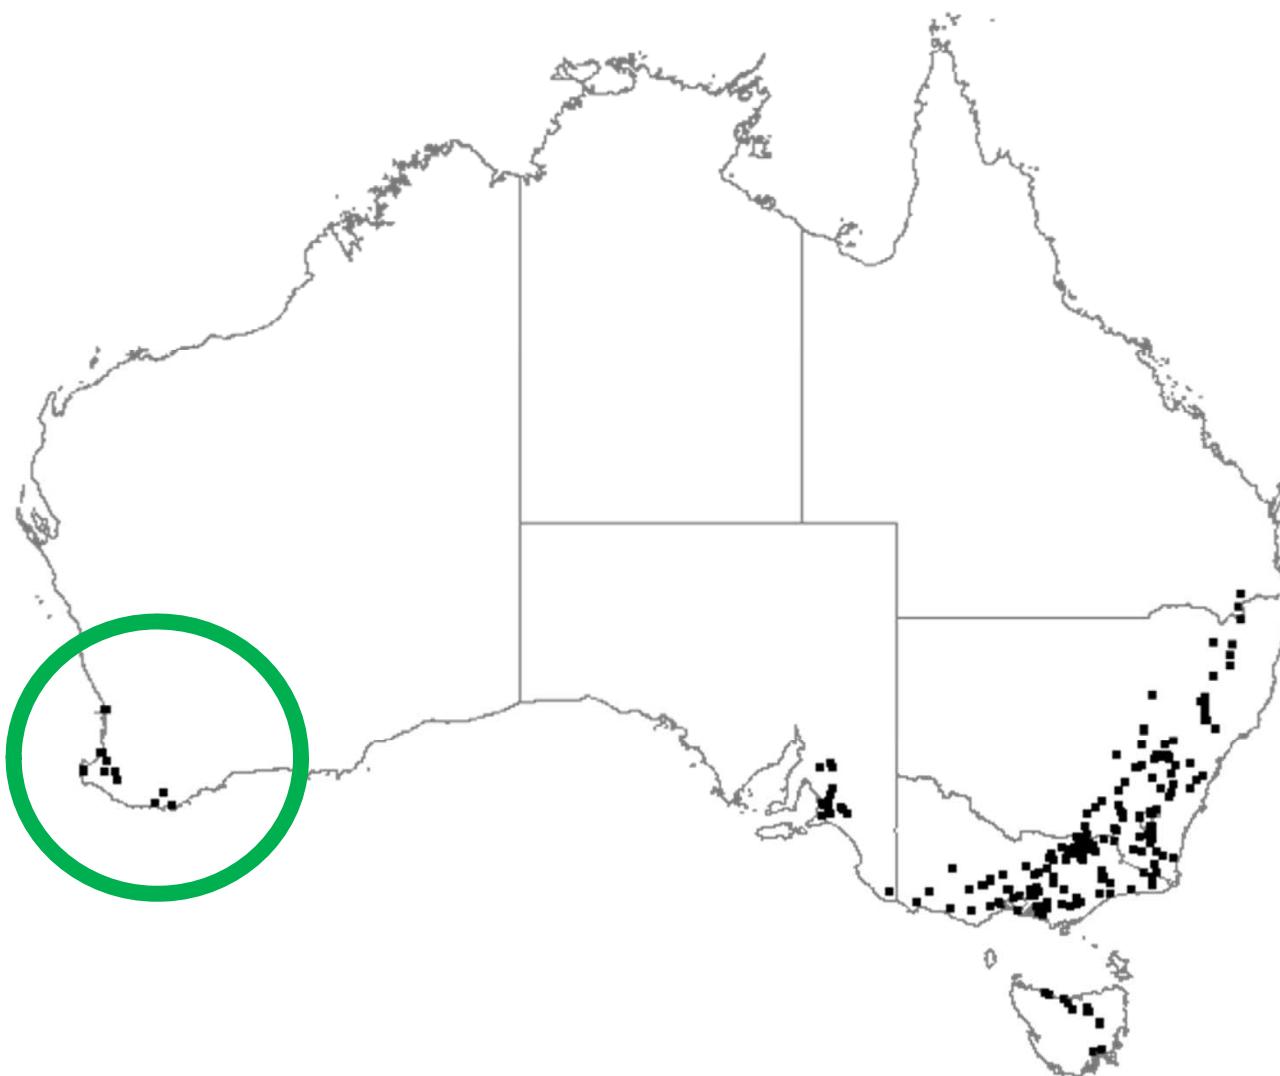

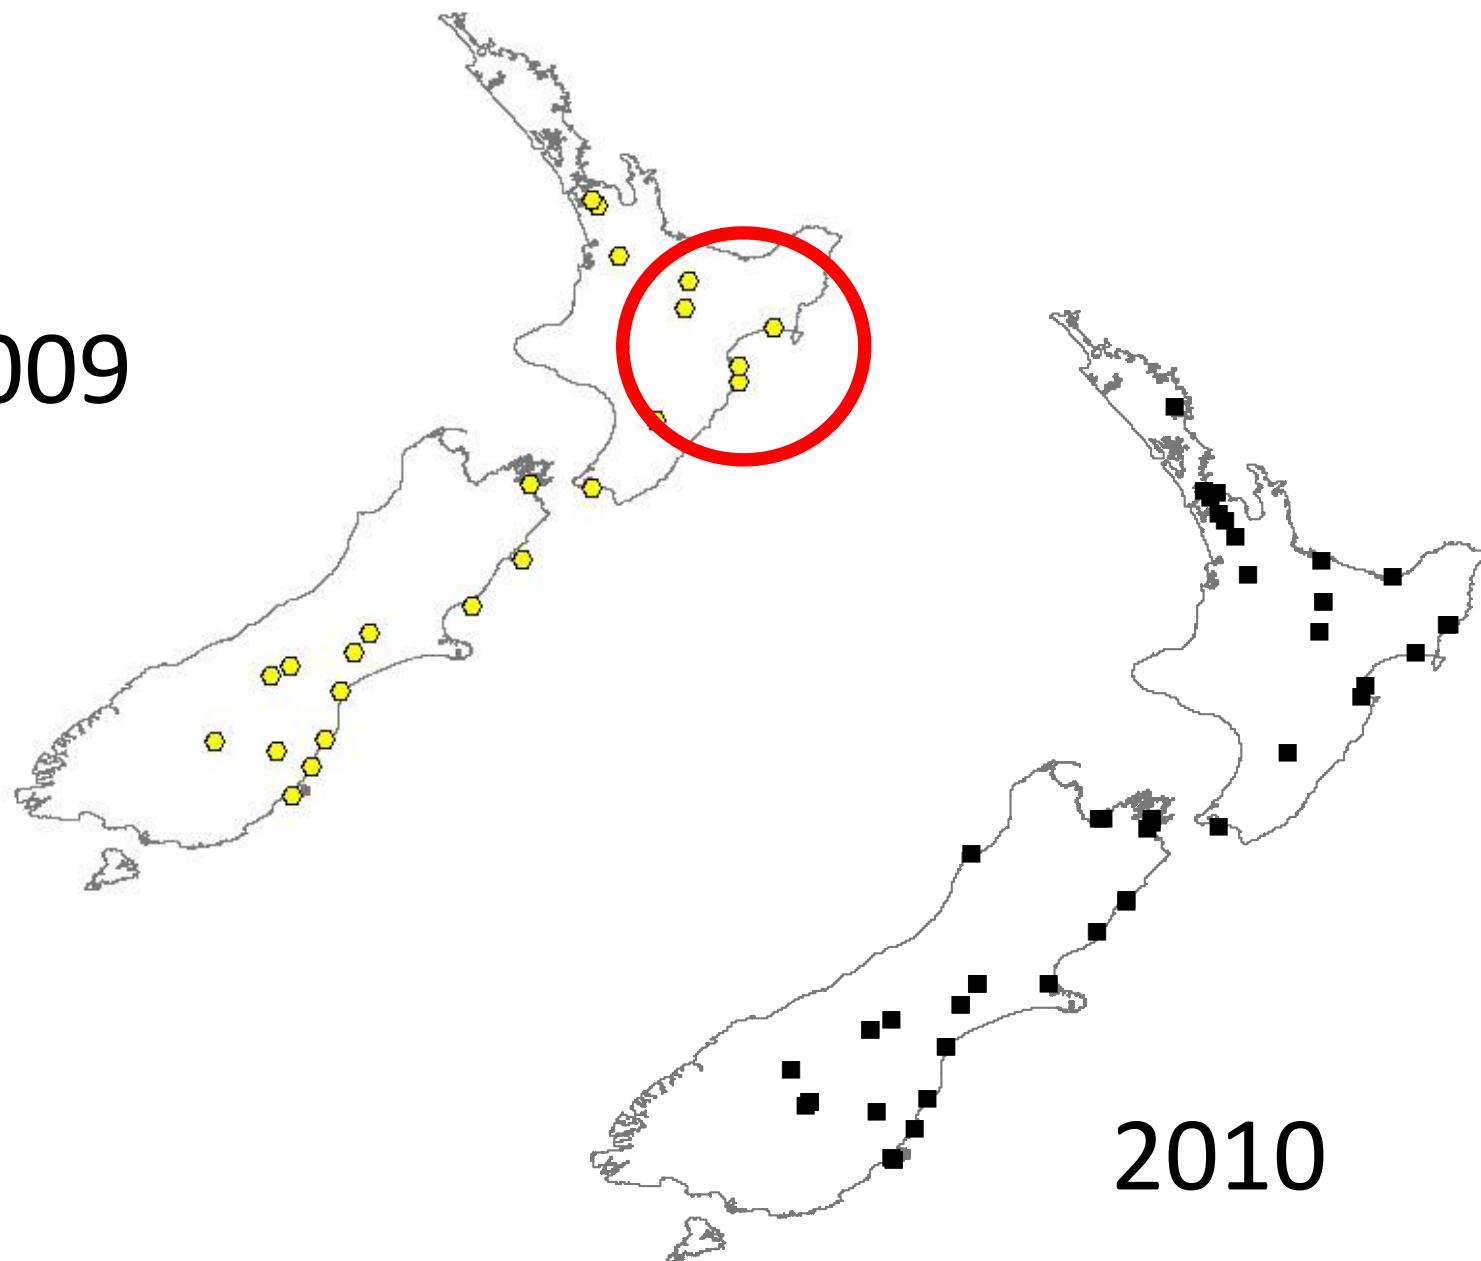

Results

- Widespread
- Temperate areas
- Still expanding in Australia
 - Patchy distribution
- Everywhere in New Zealand
 - Low population density

Distribution in 2010

2009

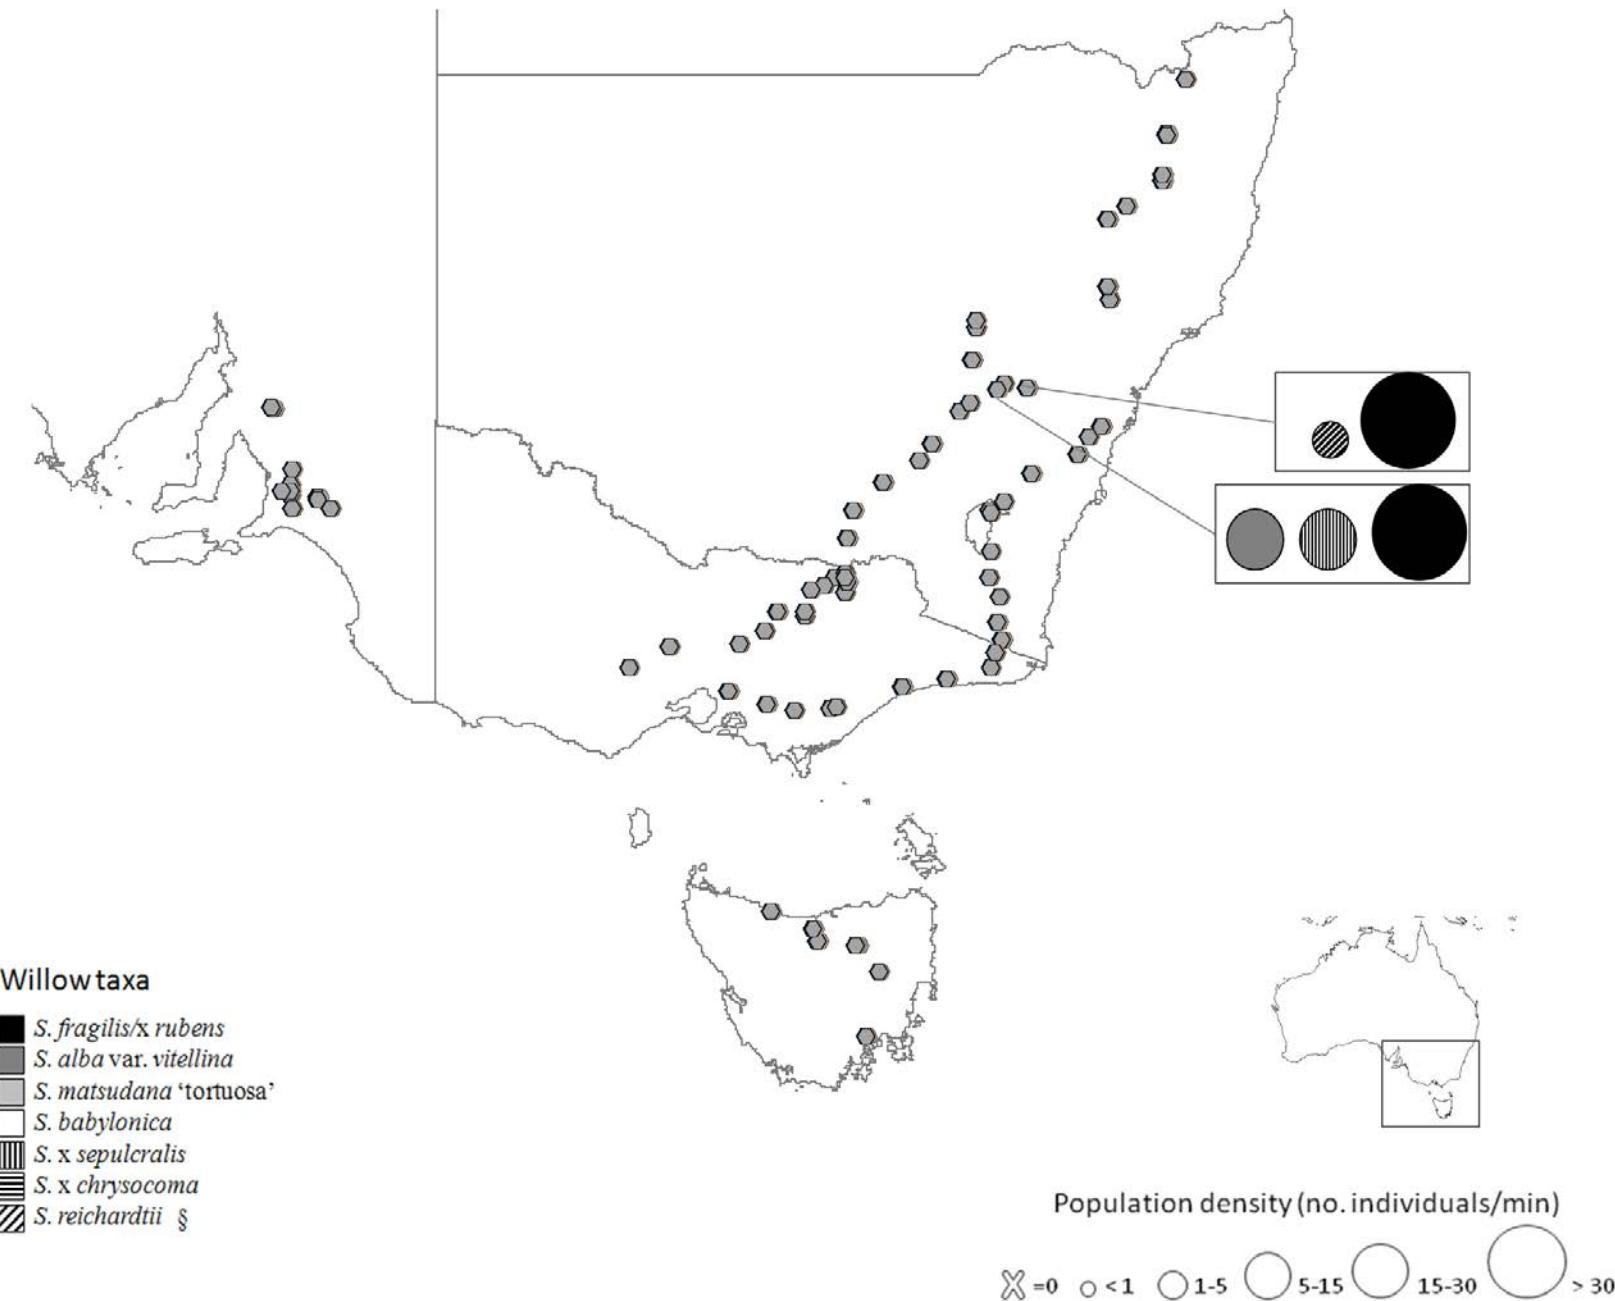

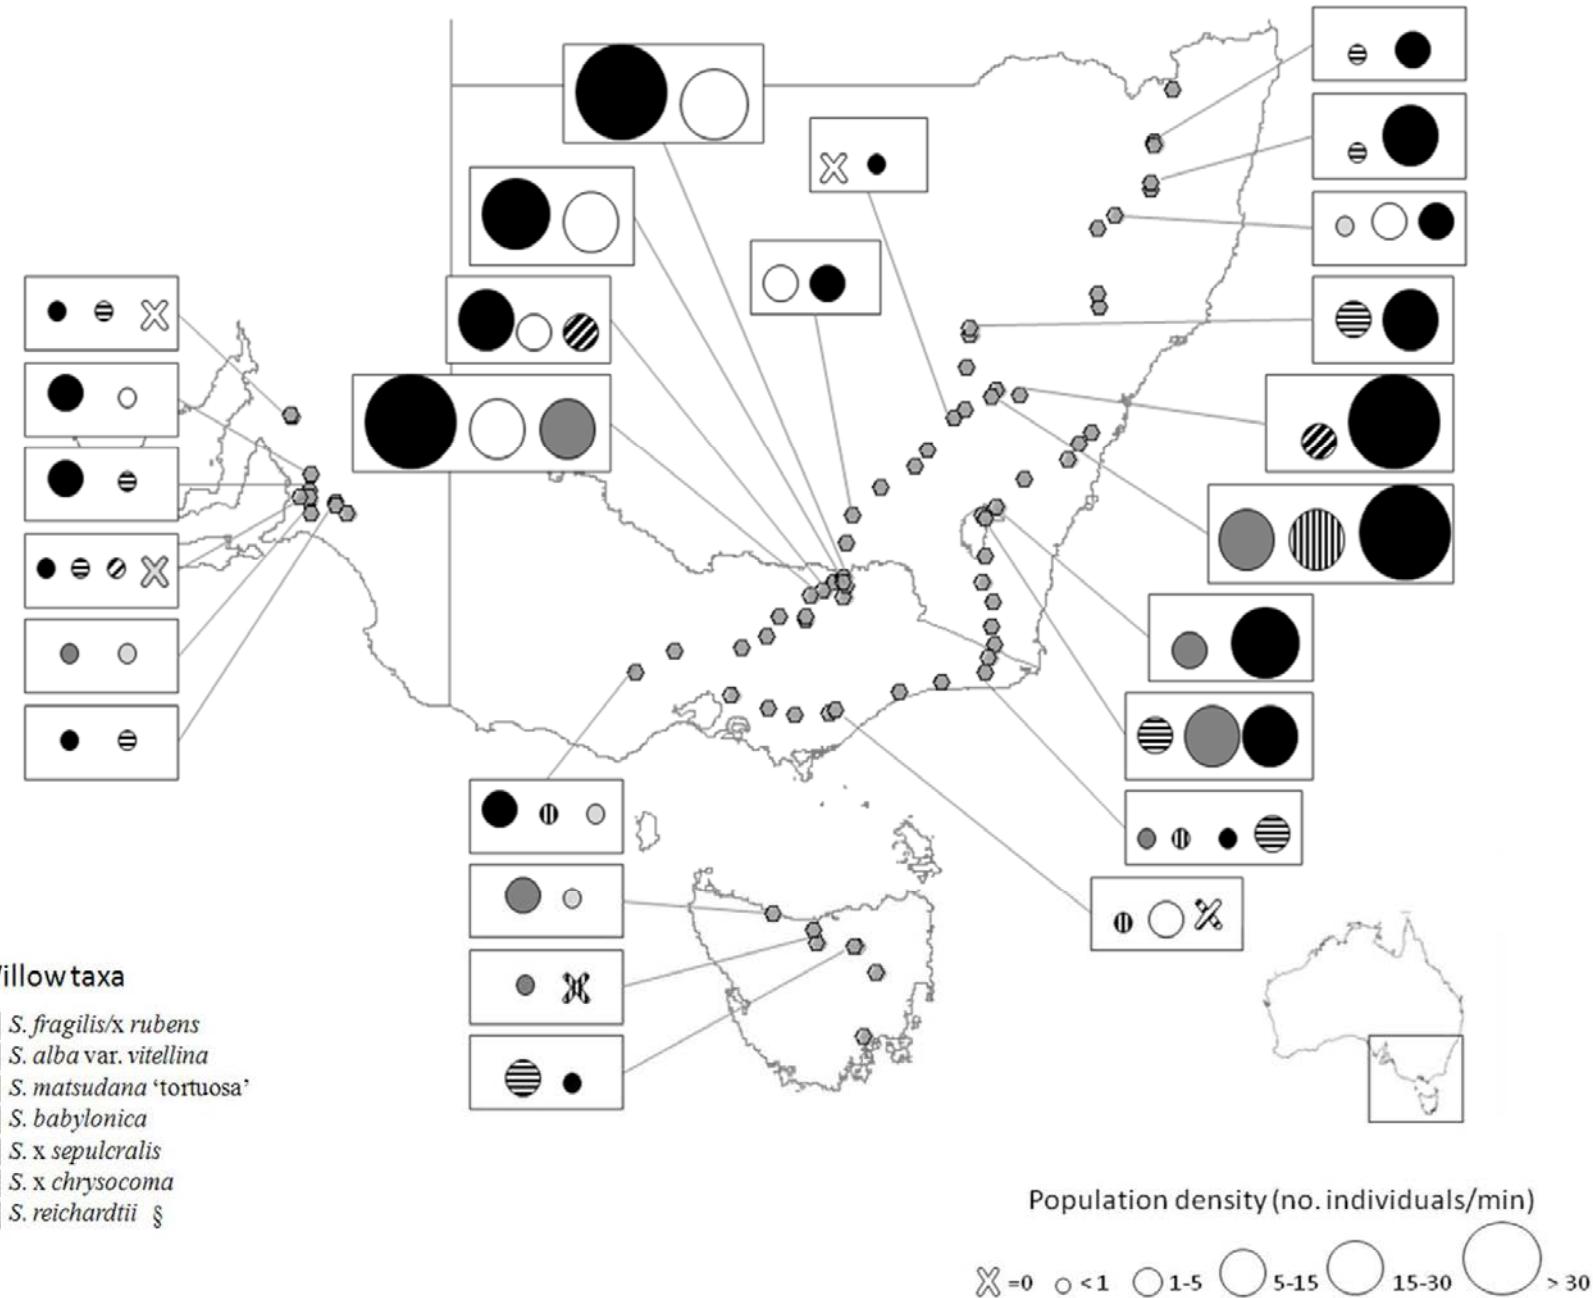

2010

Results

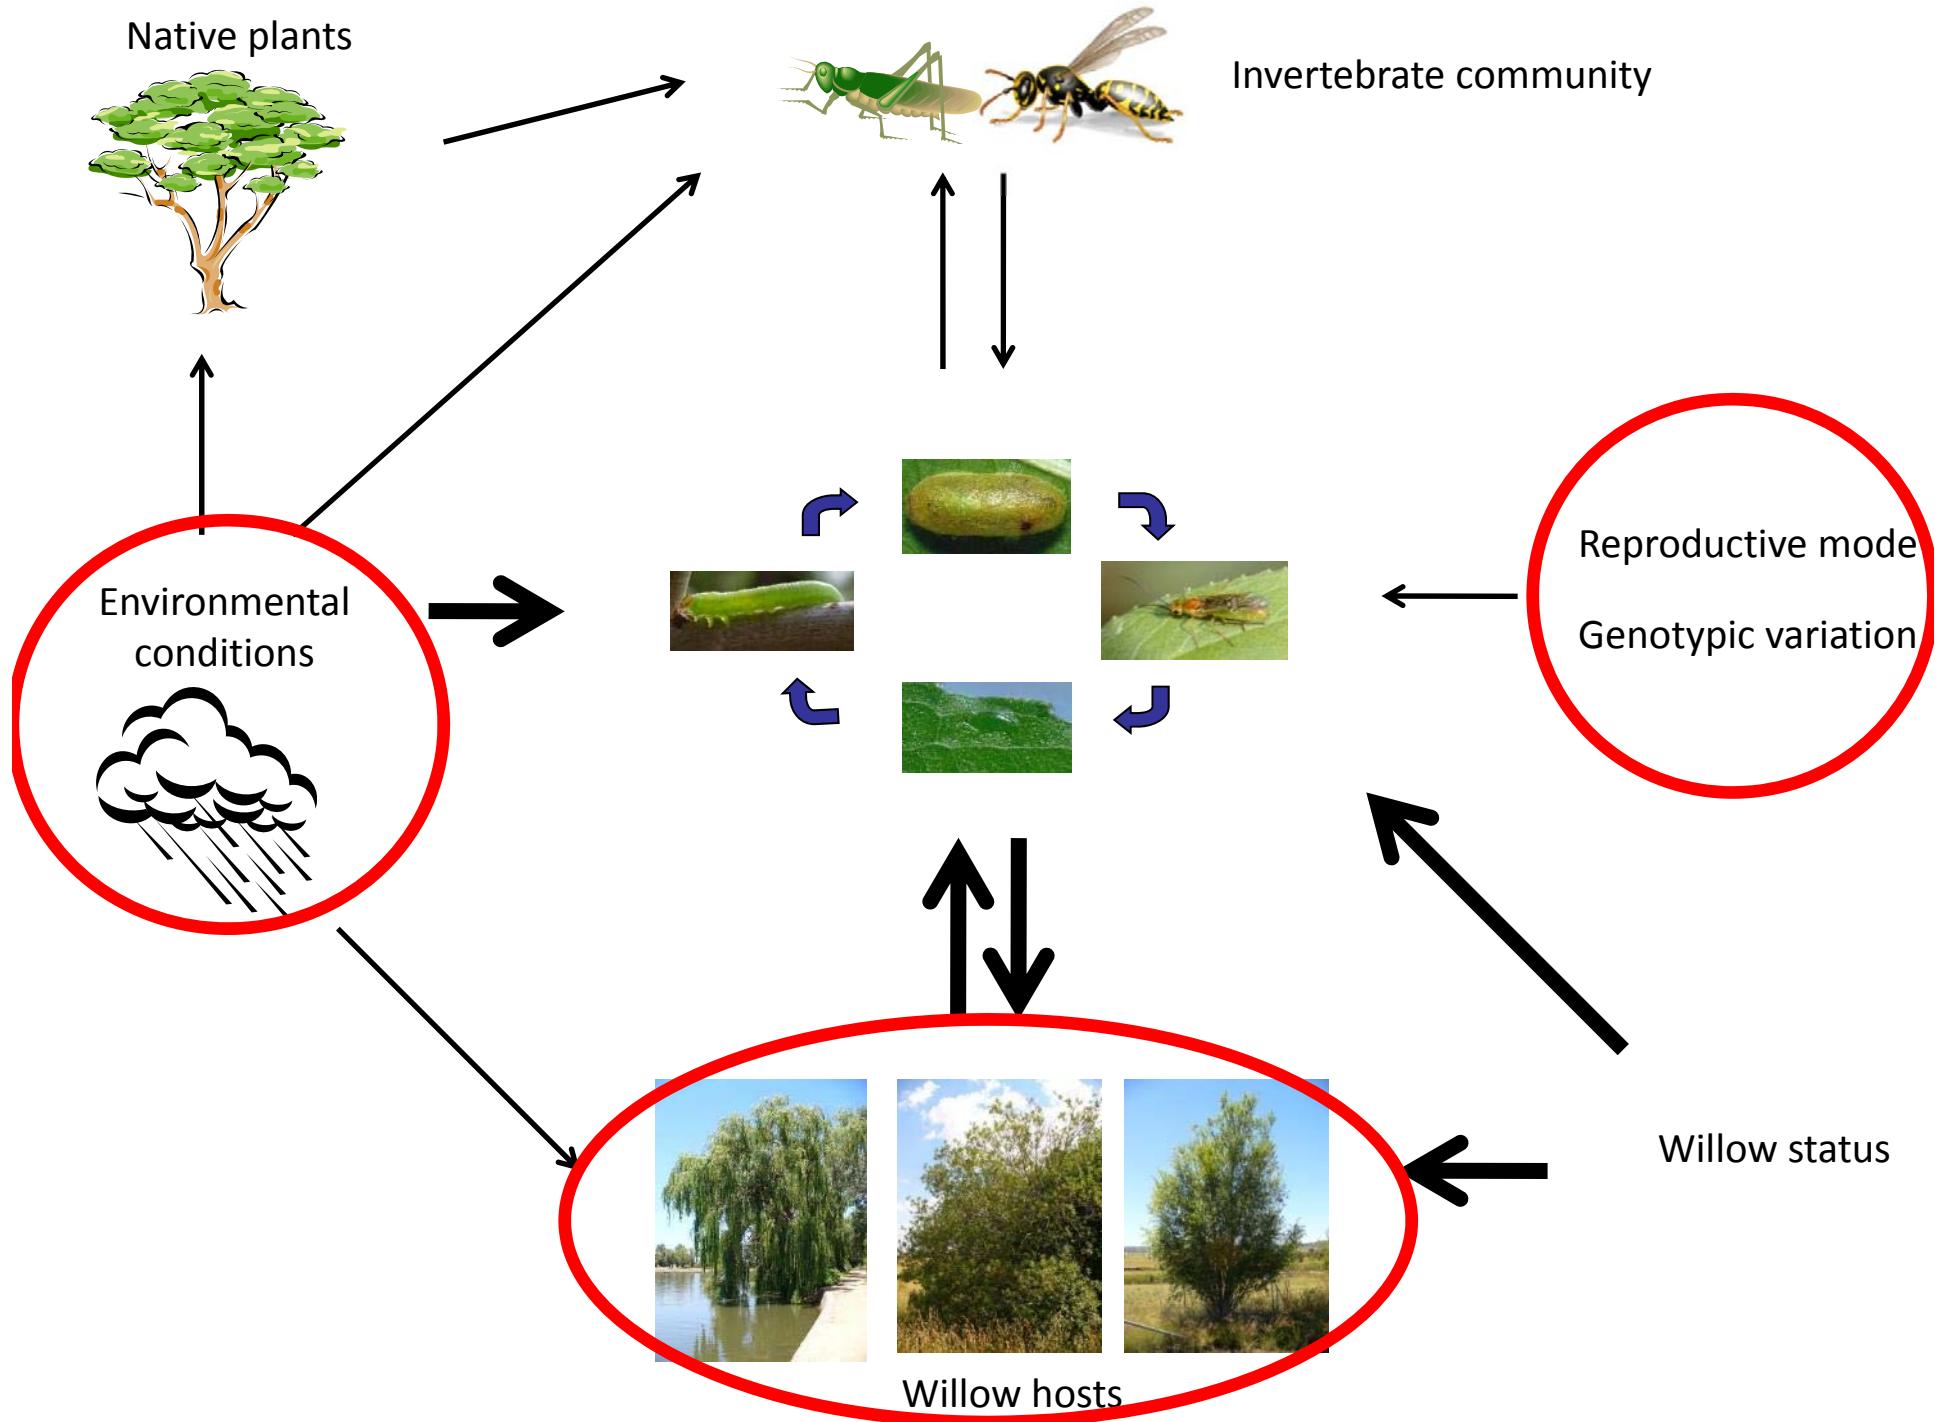

- On all willow taxa
- Different densities
- Rarely on shrub willows
- *Salix X rubens*

3-Population genetics

Aims

Determine:

- Reproductive mode
- Number of clones
- Dispersal
- Specificity to willow taxa
- Different climatic regions

Methods

- Microsatellite marker development
 - 41 markers
 - 300 *N. oligospilus* - invasive range
 - 12 tenthredinid species

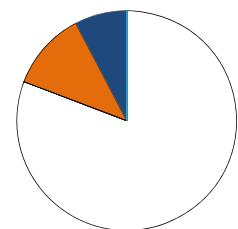

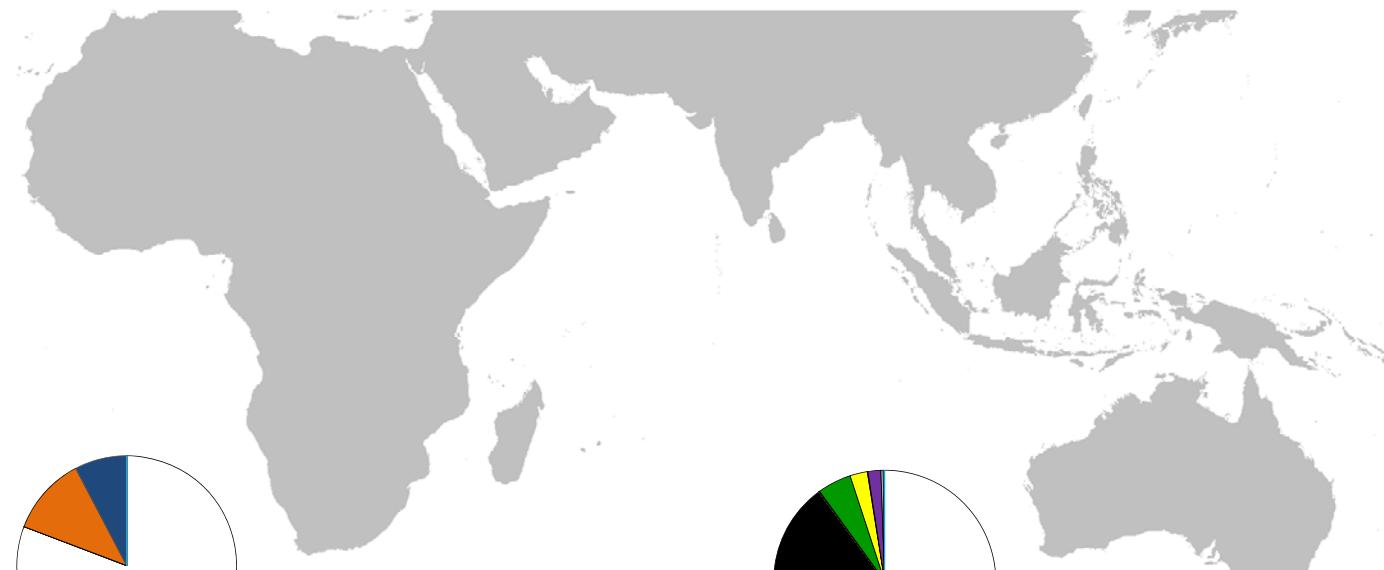

Methods

- 25 markers
 - Screened >1000 individuals
 - New Zealand
 - Australia
 - South Africa
 - 10 individuals/site/tree

Results

- Parthenogenetic
 - males present (2!)
- 16 genotypes
 - Closely related
- 2 superclones

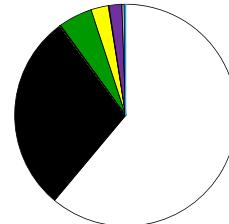

South Africa

N=26

No. clones: 3

Unique clones: 1

Australia

N=912

No. clones: 10

Unique clones: 7

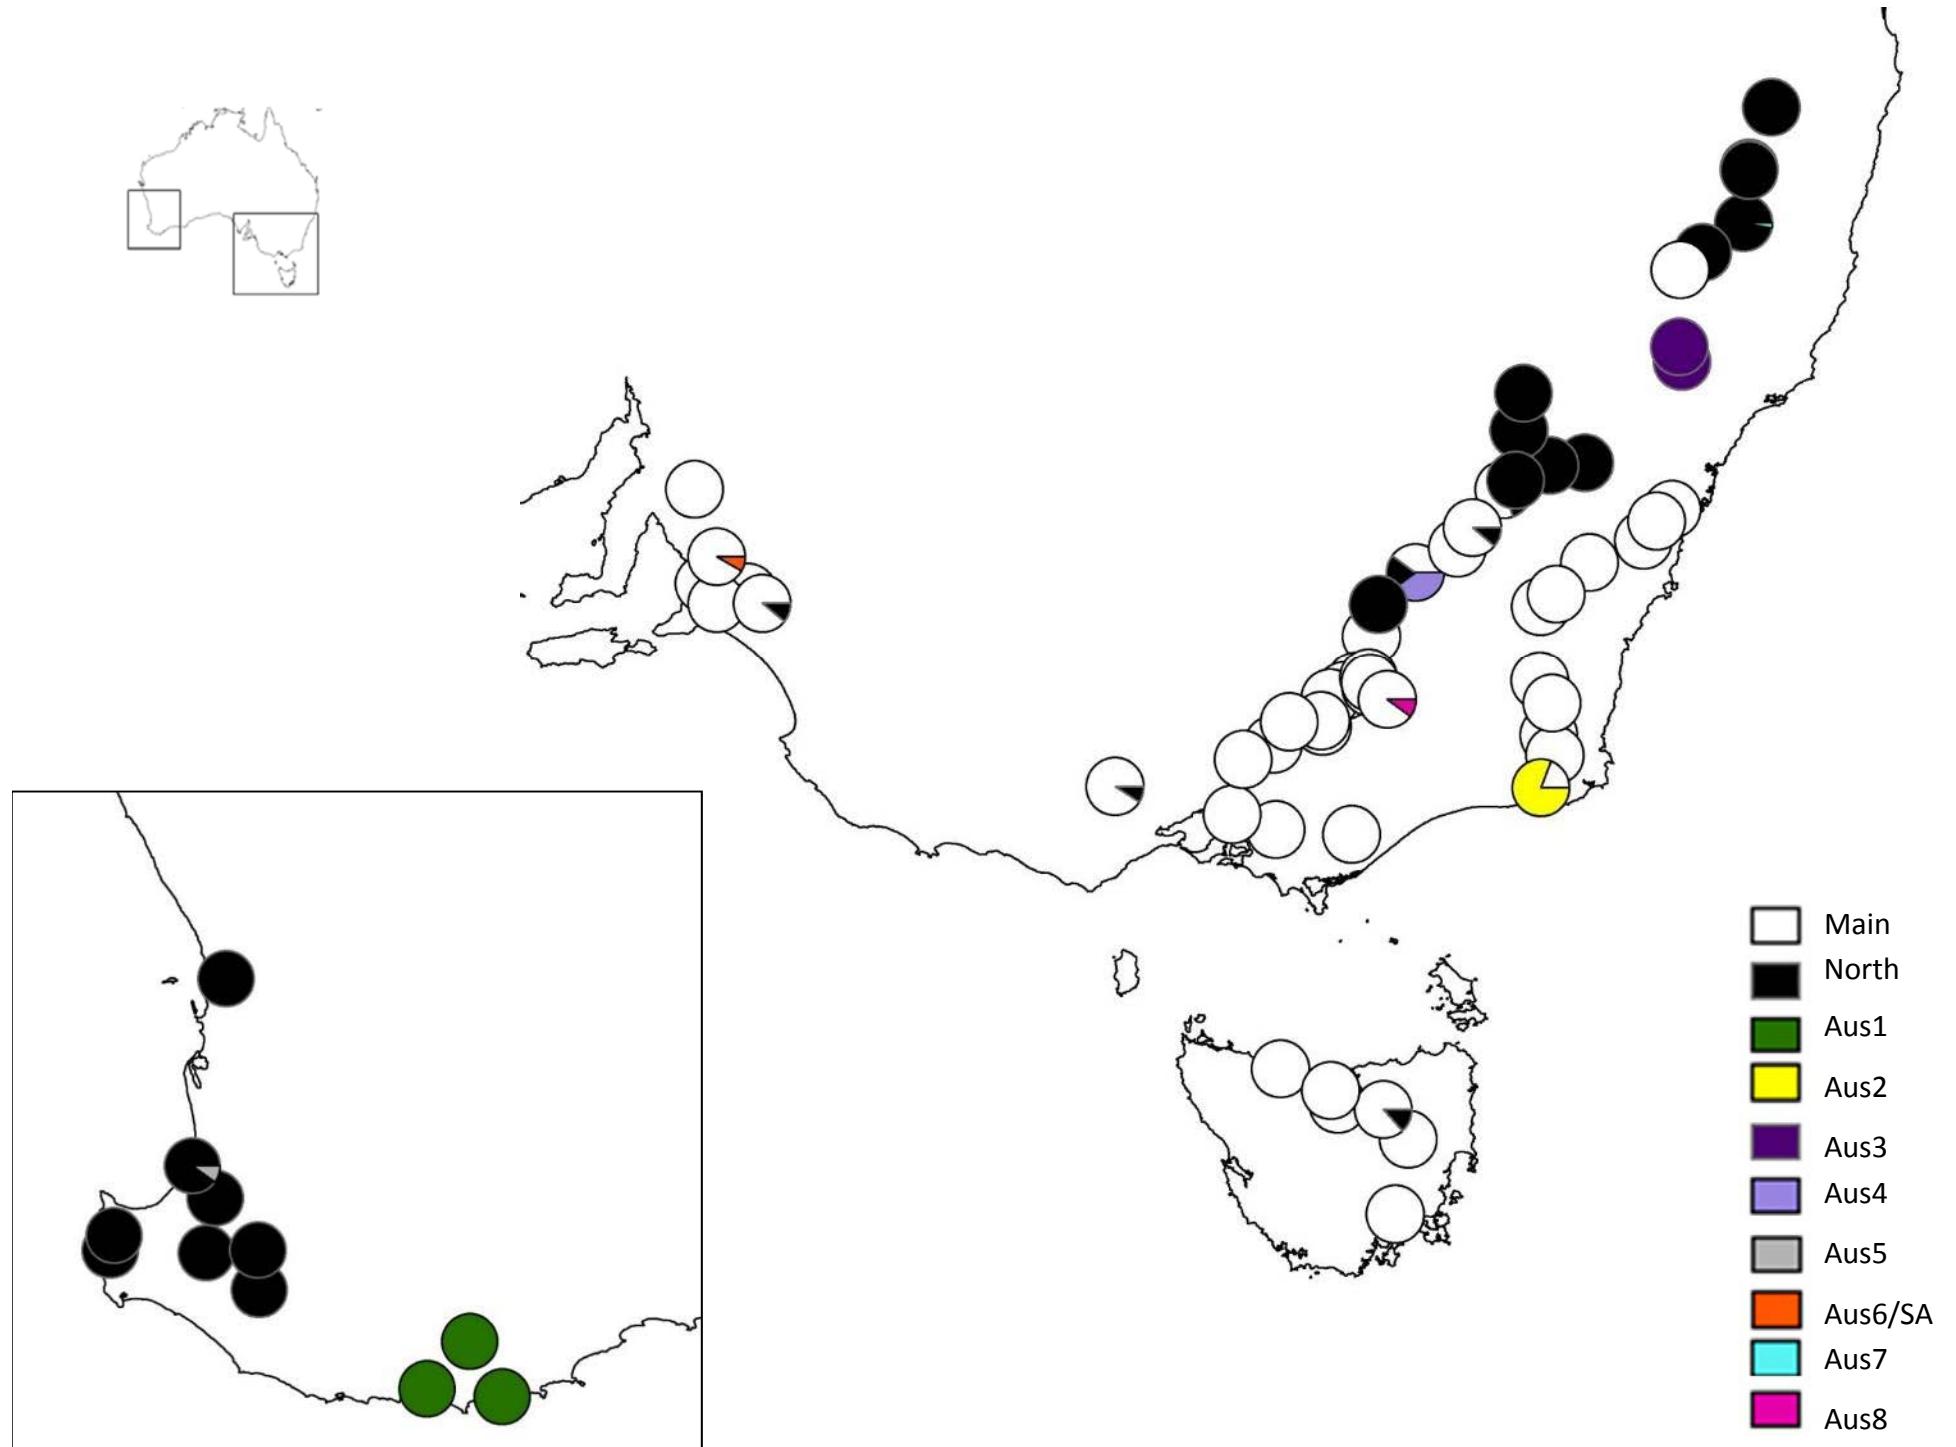

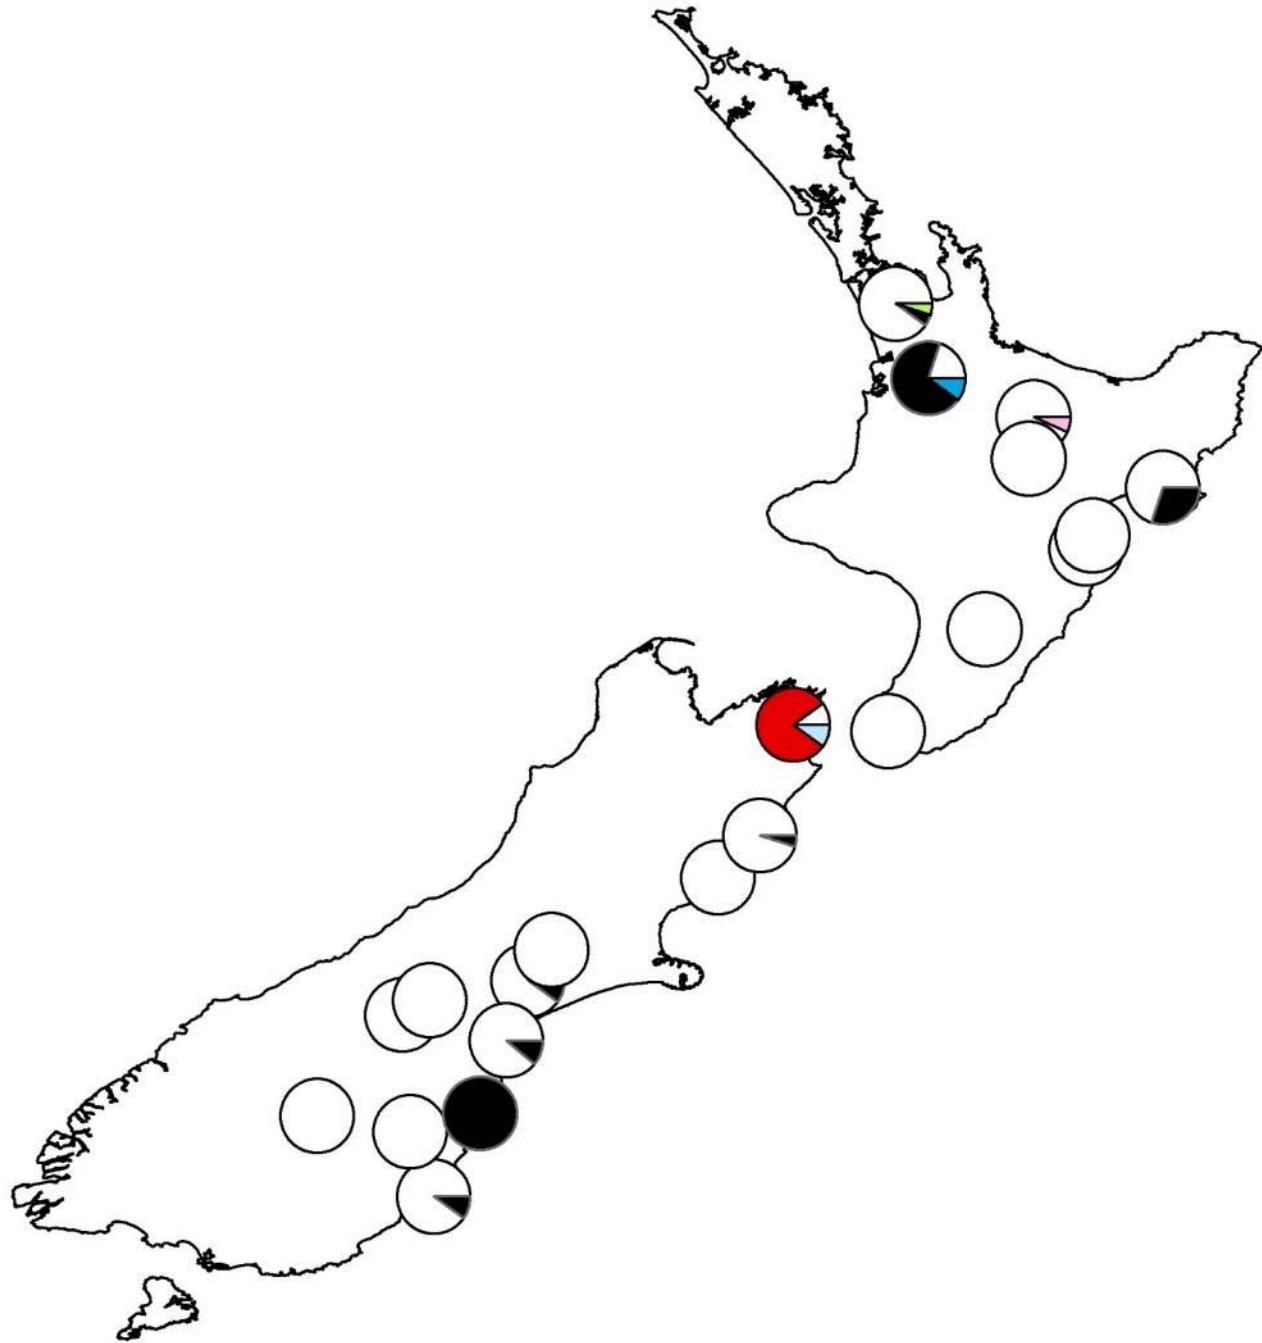

New Zealand

N=219

No. clones: 7

Unique clones: 5

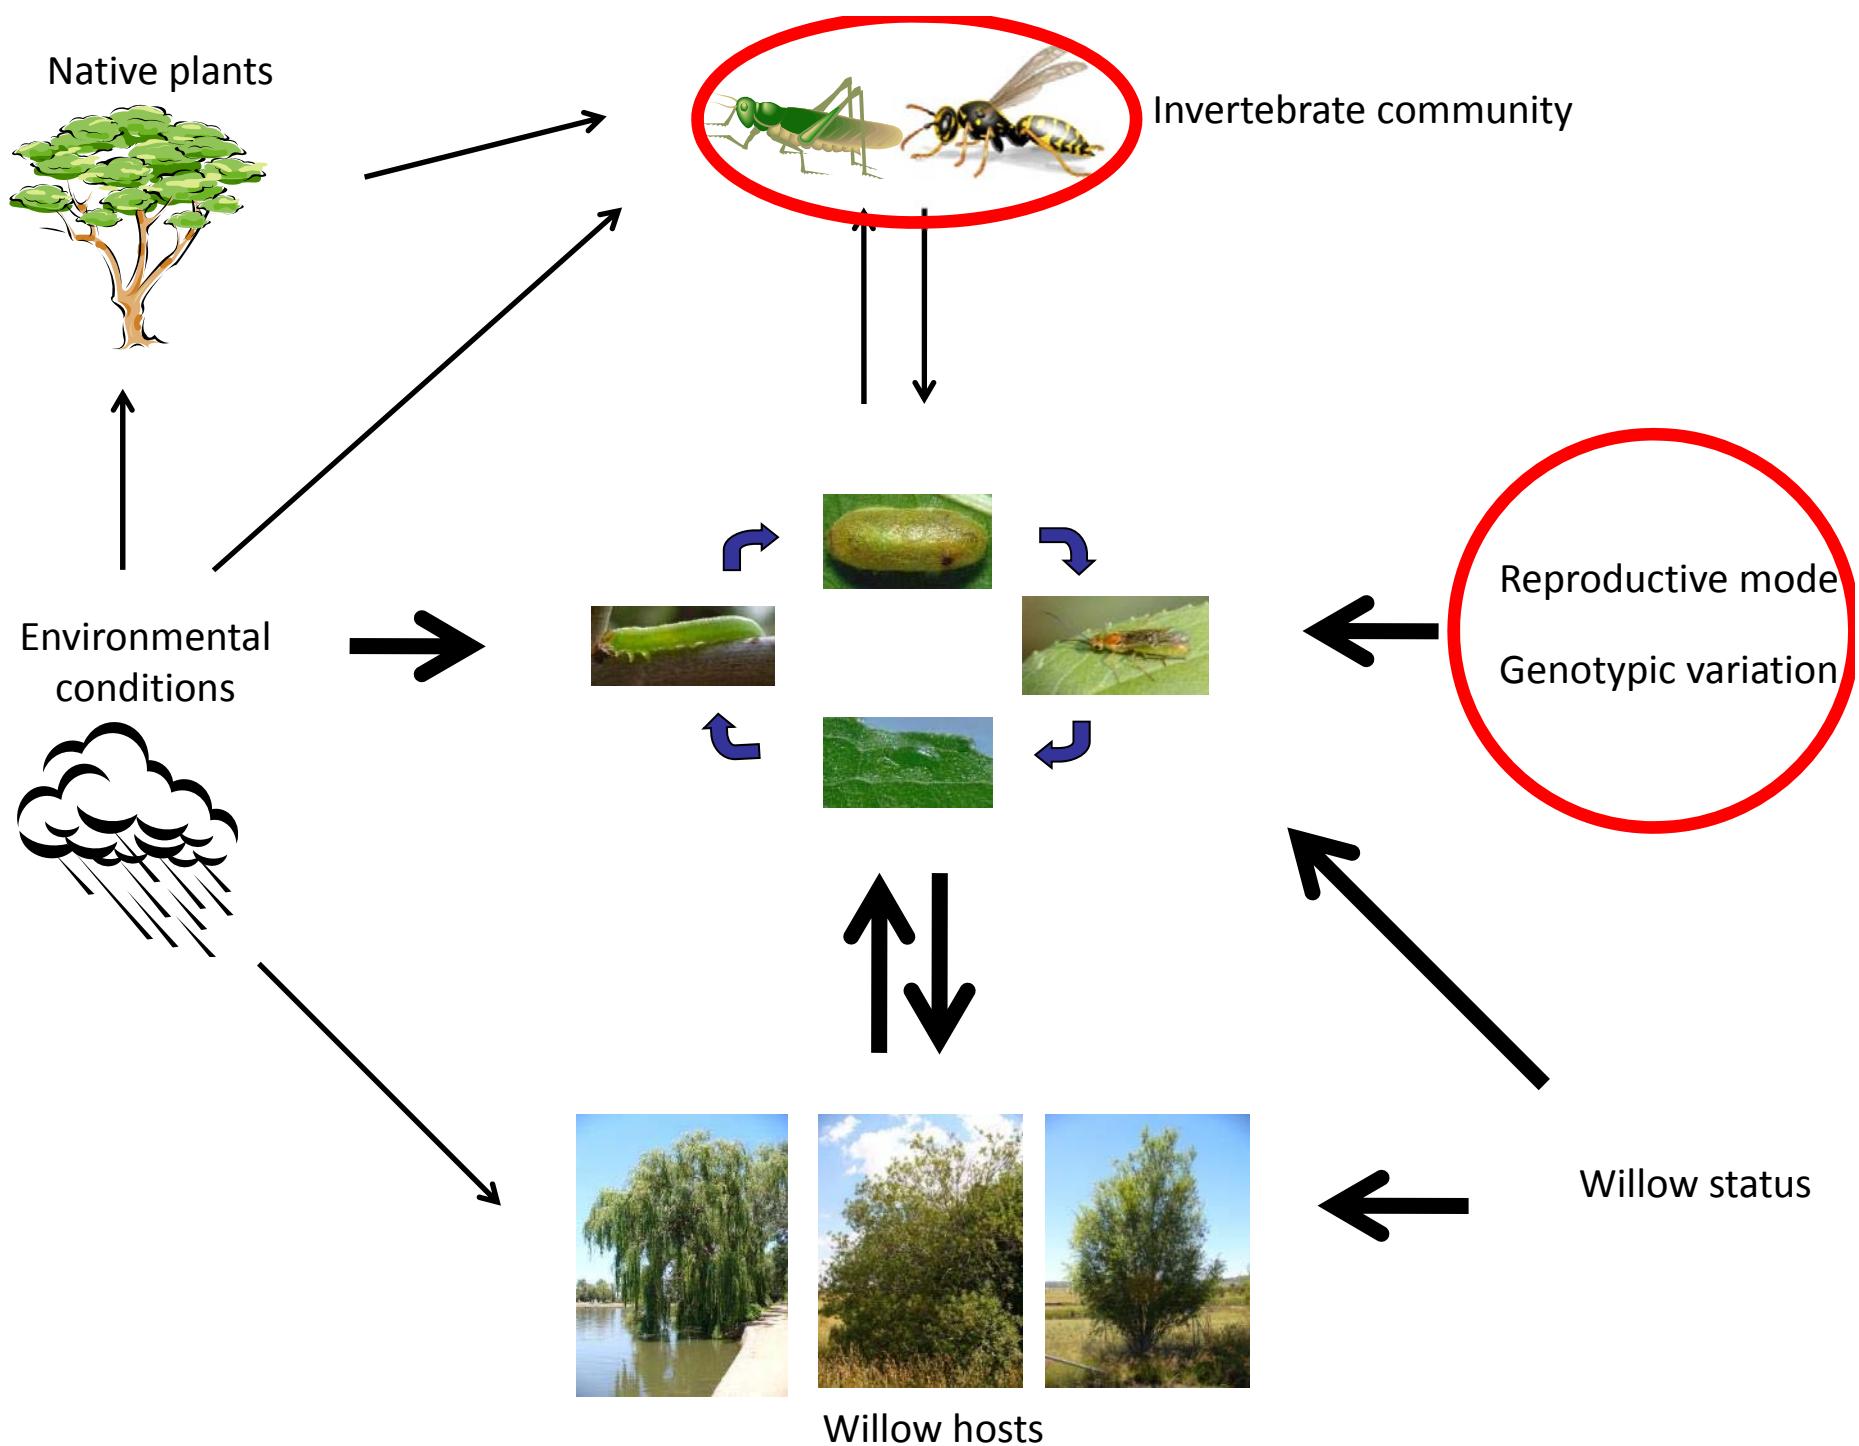

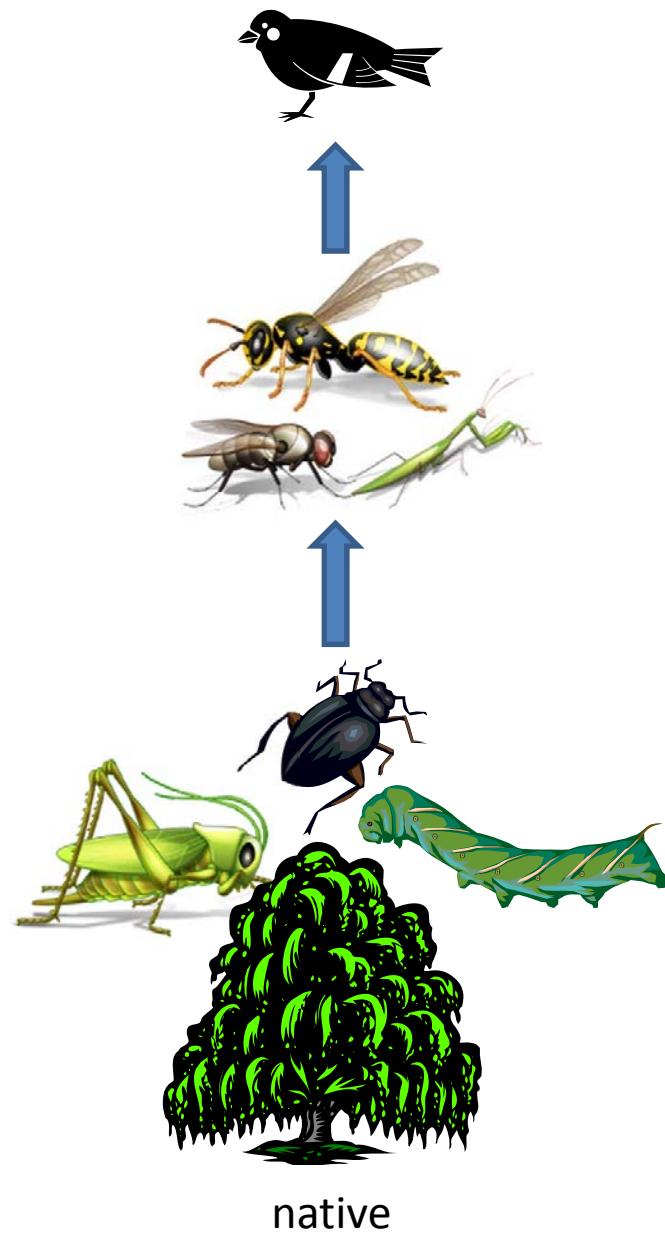

- Main
- North
- NZ1
- NZ2
- NZ3
- NZ4
- NZ5

Results

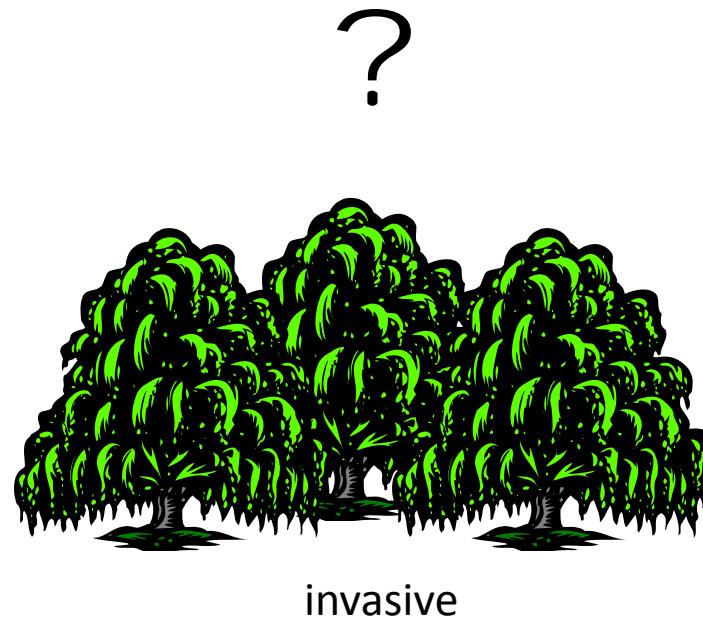

- 2 superclones
 - Wide climatic tolerance
 - No specificity to willow taxa
- Rare clones are localized
- Few introductions

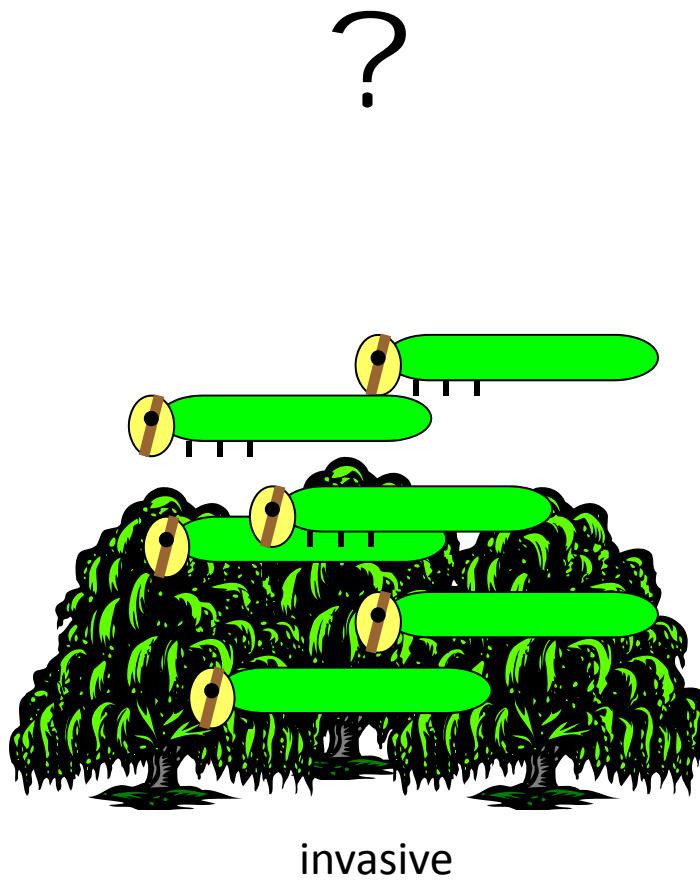

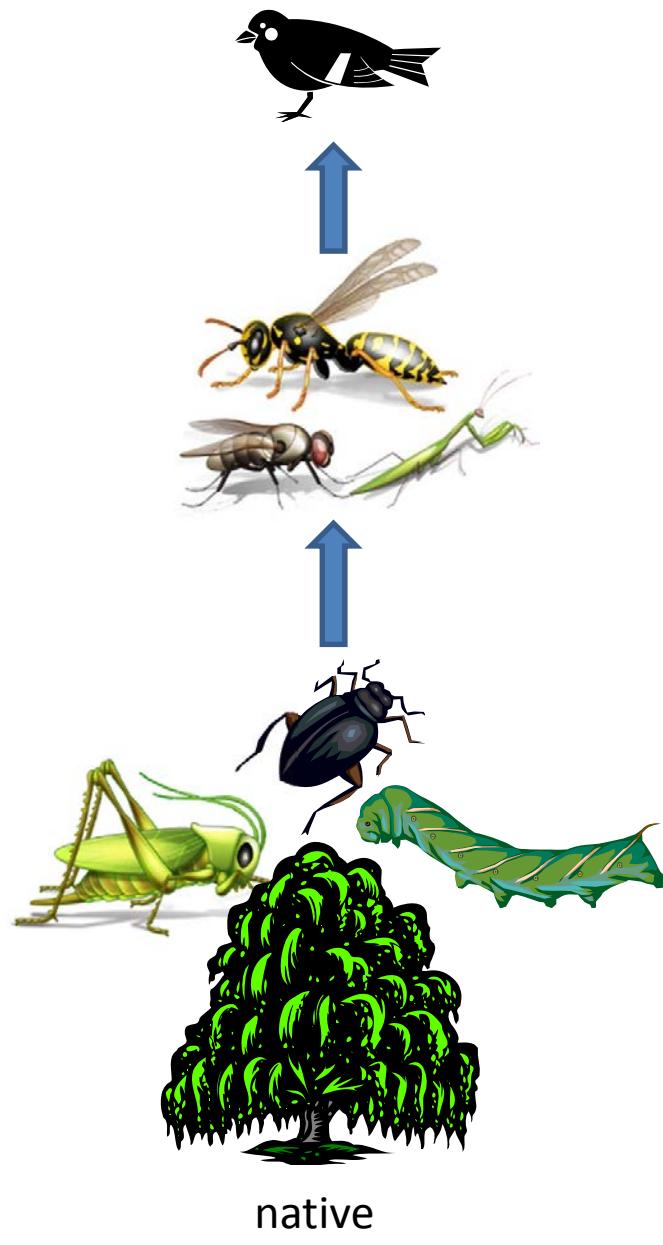

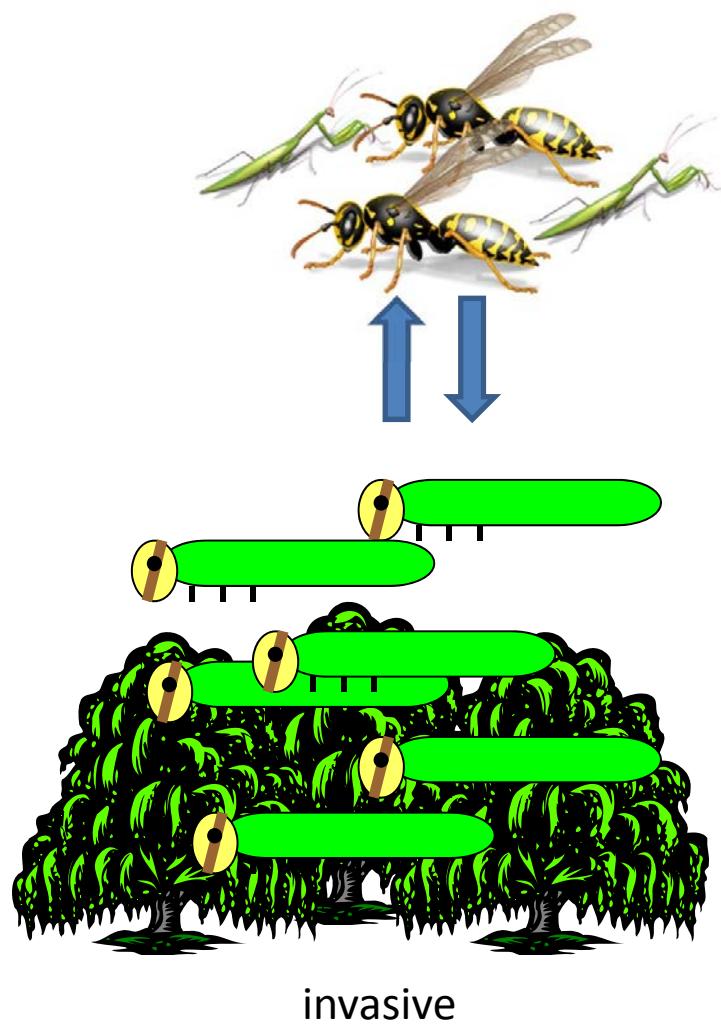

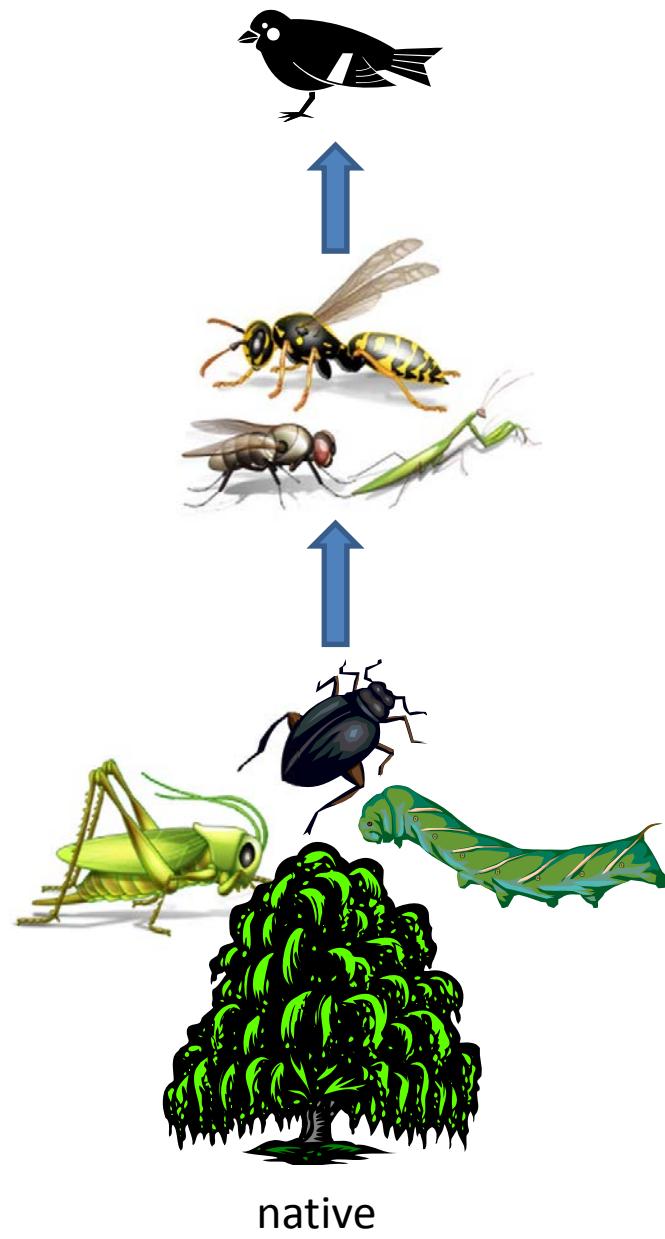

Lower biodiversity

Enemy release hypothesis

4- Invertebrate

Aim

- Compare invertebrate communities on willows under low and high sawfly densities

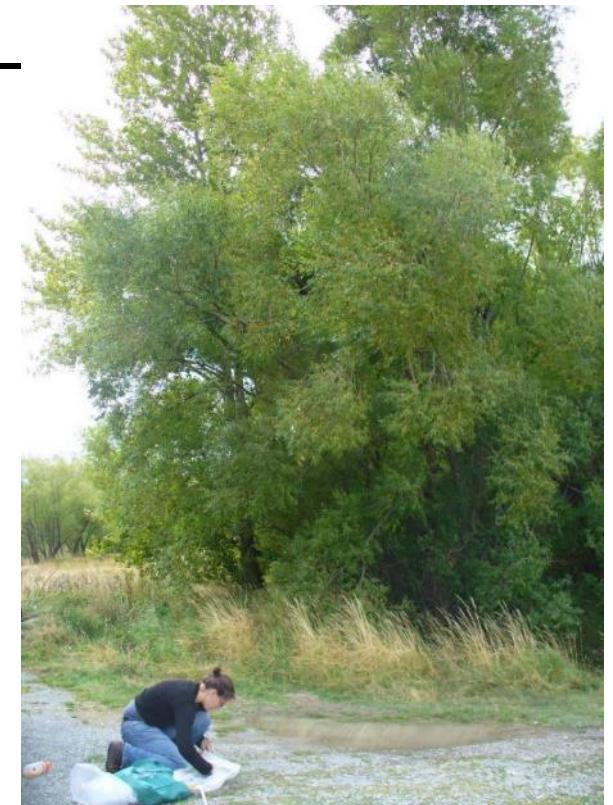

Field sites

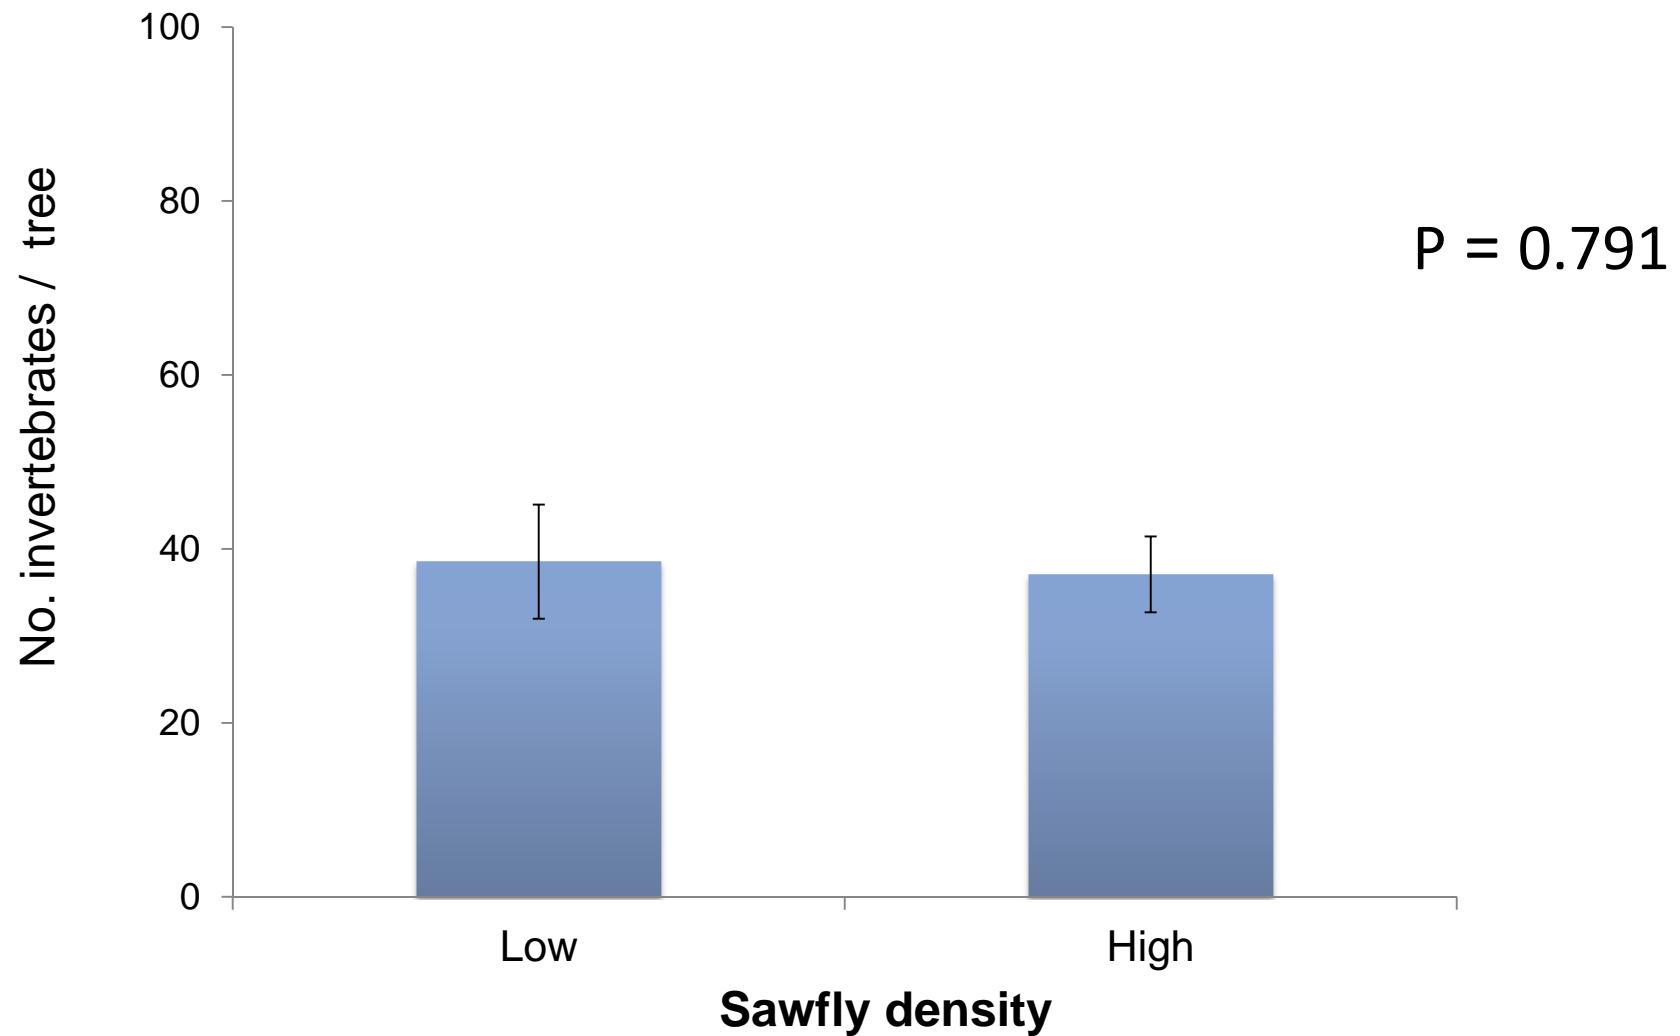

- 6 sites
 - Low and high sawfly densities
- *Salix x rubens*
- 5 trees per site

Methods

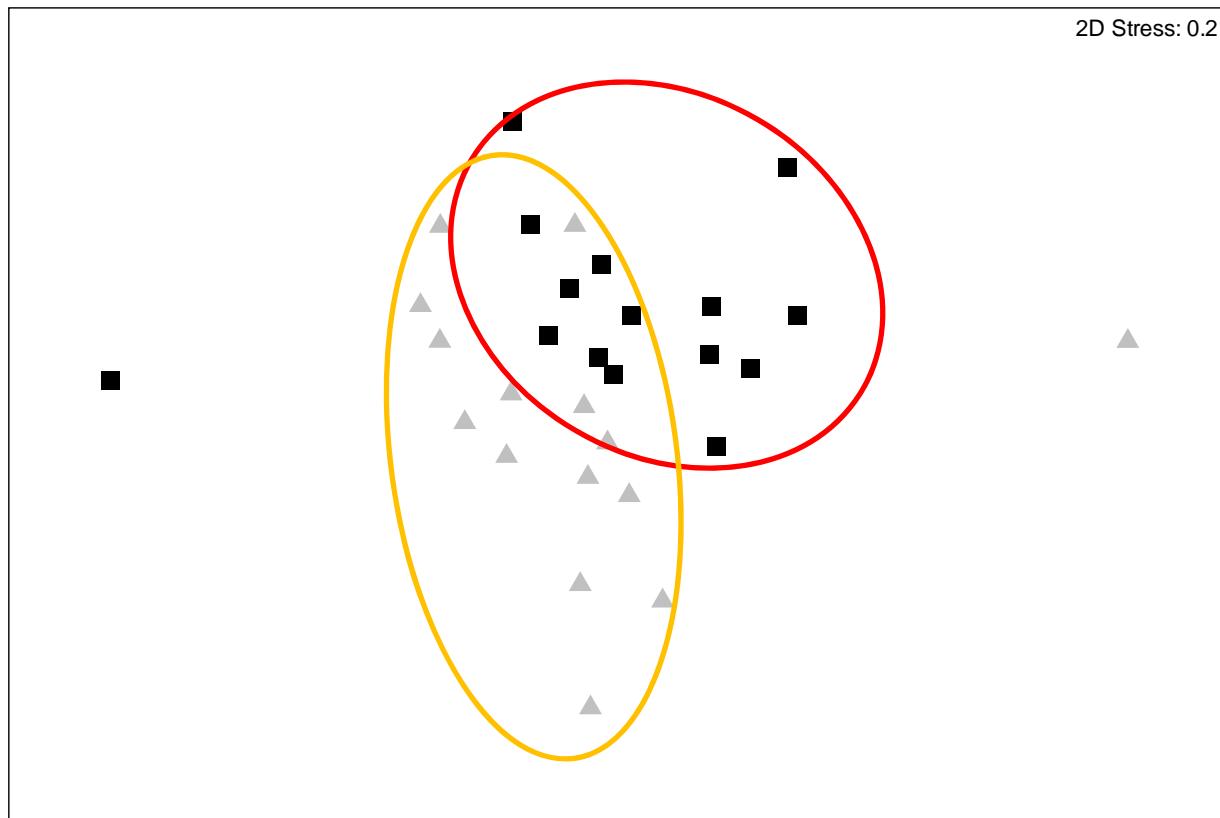

1. Visually
 - Target sessile organisms
2. Sweep net - 3 sides of trees
3. Sort to orders/functional groups

Total abundance

Community composition

P=0.001

Low

High

More herbivores

Low

More herbivores

High

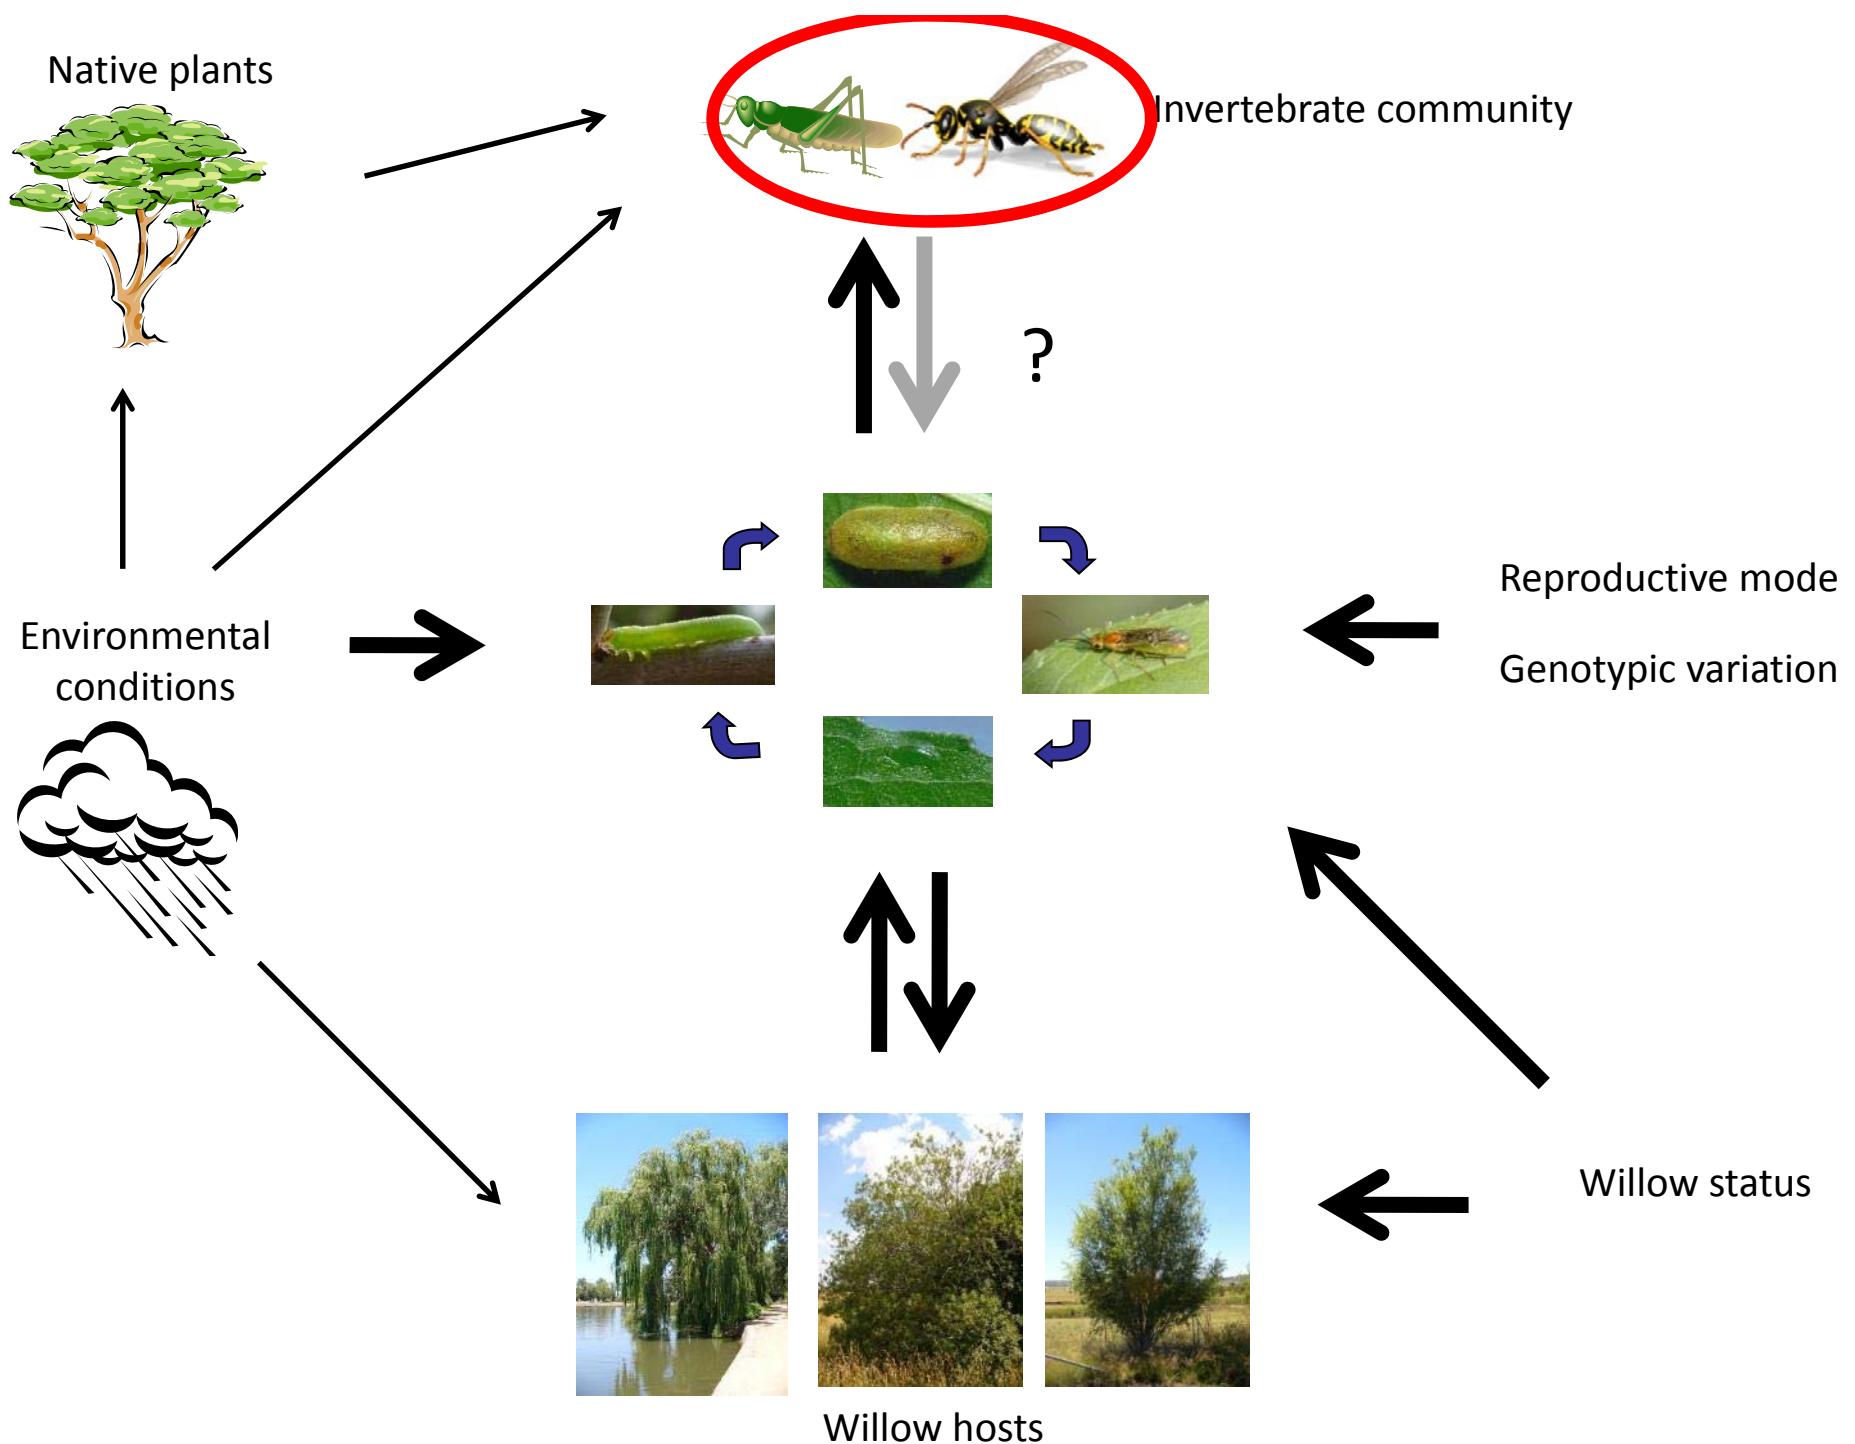

More predators

Results

- At high sawfly densities
 - More generalist predators
- Enough to control *N. oligospilus*?

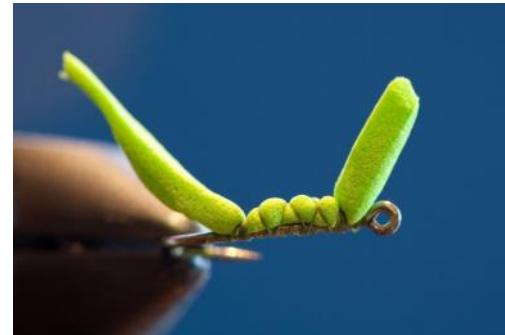

Summary

- Pest or beneficial?
- Widespread and still expanding in Australia
- Specific to willows
- Some willow preferences
- Two superclones
 - Wide tolerance

Future research

- Effect on other trophic levels
