Saturniid and sphingid moths as novel models for the study of insect diversity and macroecology

## PRESENTATION OUTLINE

- ▶ **INTRODUCTION**
- ▶ SATURNIID & SPHINGID MOTHS AS NEW MODELS
- ▶ ADVANCES IN SYNTHESIS OF INFORMATION
- ▶ UNDERSTANDING PATTERNS
- ▶ TAKE HOME MESSAGE & PERSPECTIVES

# INTRODUCTION

Conservation policies are largely derived from vertebrate and plant data

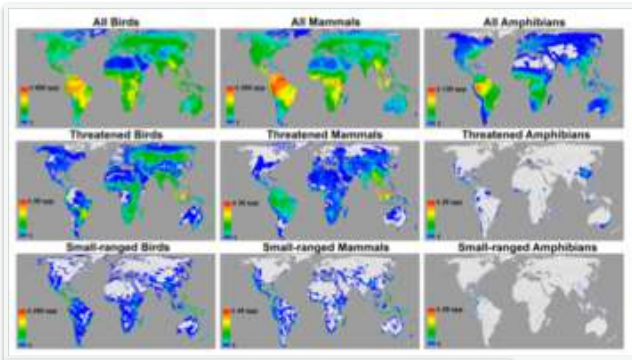

Fig. 4. Selected priority ecoregions based on small-ranged vertebrates.  
 Jenkins *et al.* (2013). Global patterns of terrestrial vertebrate diversity and conservation. PNAS 110

Kreft & Jetz (2007). Global patterns and determinants of vascular plant diversity. PNAS 104

1.3. The diversity of insects is extraordinary and varied.

Insects make up for ~ 50% of species worldwide and play important ecological role. Affected by climate change and habitat disturbance

# INTRODUCTION

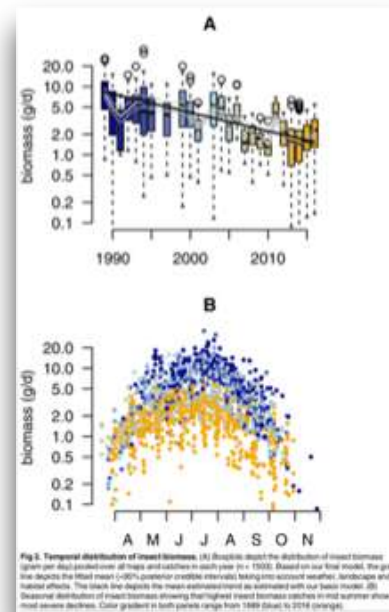

Loss of insects jeopardize ecosystem services.

RESEARCH ARTICLE

## More than 75 percent decline over 27 years in total flying insect biomass in protected areas

# SATURNIID & SPHINGID MOTHS AS NEW MODELS

- Intermediate species richness (ca. 5000 sp.)
- Global distribution
- Very popular among collectors, many records! (occurrences)

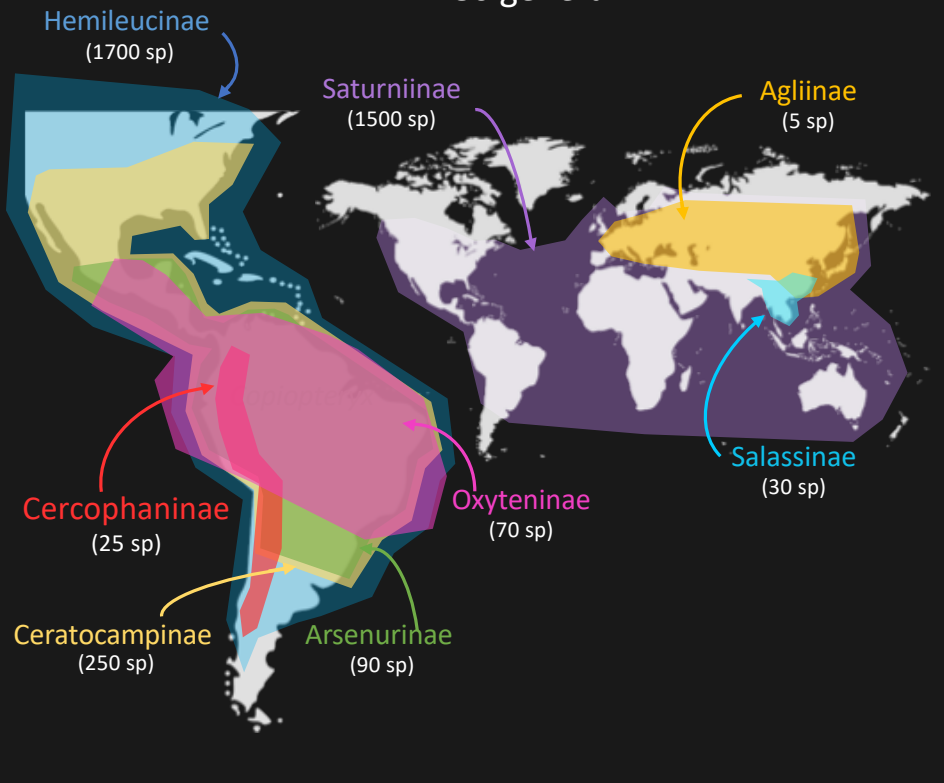

## Saturniidae

3454 species & ssp

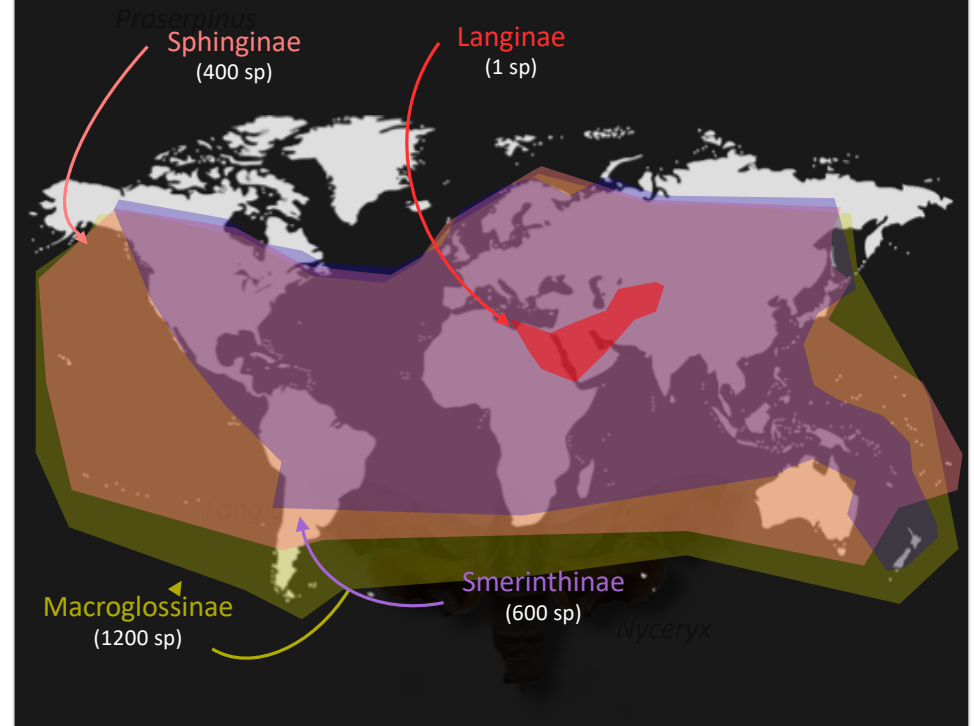

- 8 sub-families
- 15 tribes
- 180 genera

## Sphingidae

1602 species & ssp

- 4 sub-families
- 14 tribes
- 205 genera

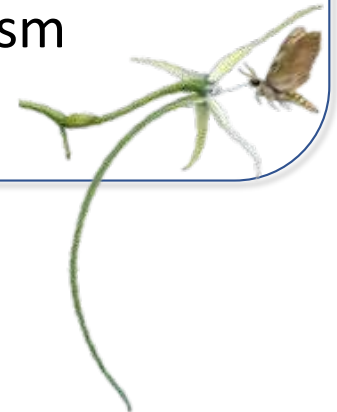

## Saturniidae

- 
- Most species do not feed when adults
  - Relatively low flying capacities
  - Short adult lifespan
  - Mostly Generalist caterpillars
  - Sexual dimorphism

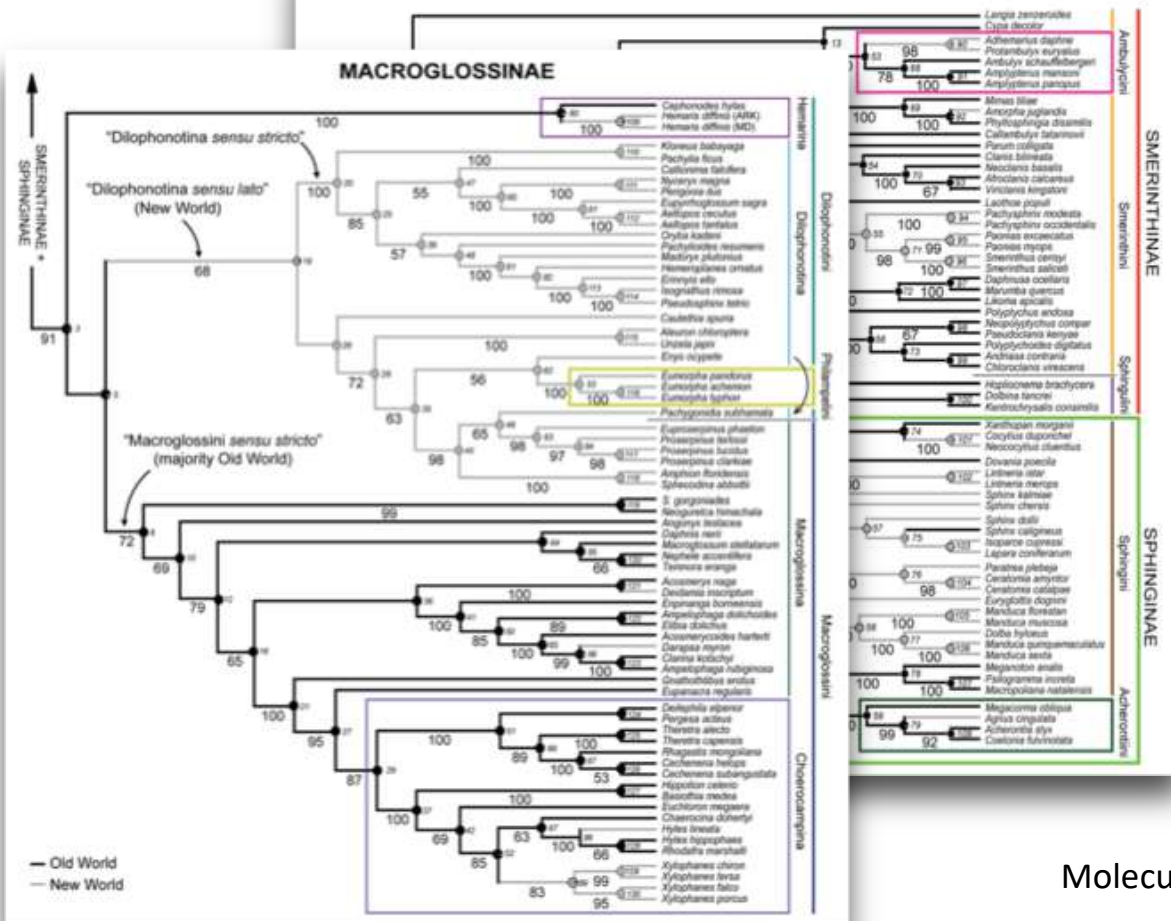

## Sphingidae

- Wide spectrum in feeding habits
- High flying capacities
- Longer adult lifespan
- Mostly specialist caterpillars
- Low sexual dimorphism

# SATURNIID & SPHINGID MOTHS AS NEW MODELS

## SMERINTHINAE + SPHINGINAE

- ▶ **UNDERSTANDING PATTERNS**
- ▶ TAKE HOME MESSAGE & PERSPECTIVES

## Latitudinal gradient of Diversity

The most pervasive pattern of life on earth.....

We know that there are more species in the tropics..... BUT

The most obvious question and yet the most elusive answer

## UNDERSTANDING PATTERNS

### How many species are there in the Tropics?

Taxonomical descriptions are not as fashionable anymore (early 20<sup>th</sup> century).

A combination of molecular information (i.e. DNA barcodes) and integrative taxonomy is changing lately the taxonomy of insects. They have also revealed many cryptic species (most of them in the tropics)

Recent inflation in species number: Sat 1500sp ; Sph 250sp (more waiting to be described!)

Uncertainty in species identification especially for historical records.

Great wealth of barcodes data after 10 years sampling ready to be used.

Estimating species richness from barcodes

Does it correlate with previously published estimates?

# UNDERSTANDING PATTERNS

	Saturniidae	Sphingidae
Number of records	46117	26096
Number of unique records	25716	15090
Number of BINS	4141	1940

BIN = Barcode Index Number, as proxy for species

**Using DNA BARCODES: Balance between more accurate account of species diversity vs more limited sample size (30%)**

Observed richness at 200km cell-size

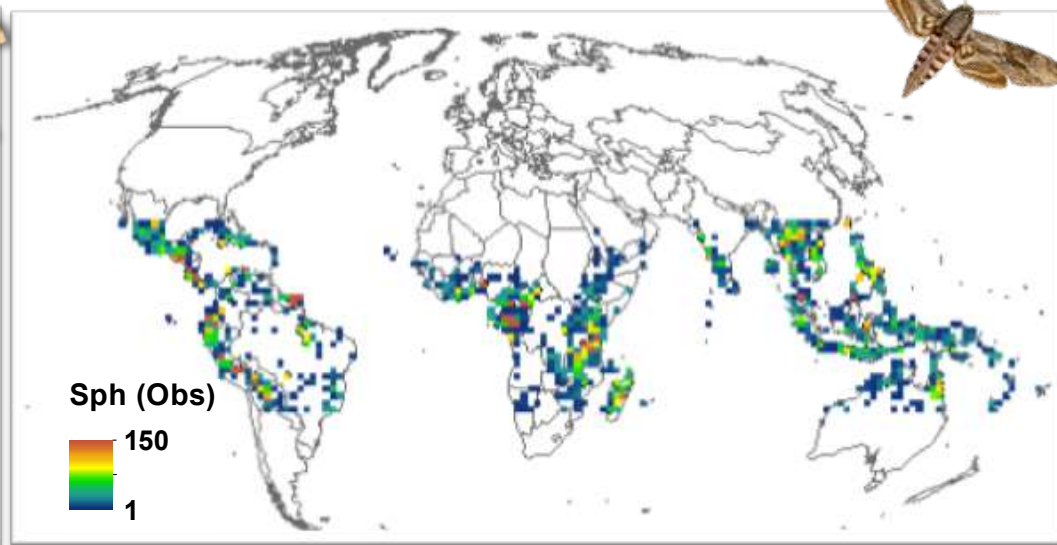

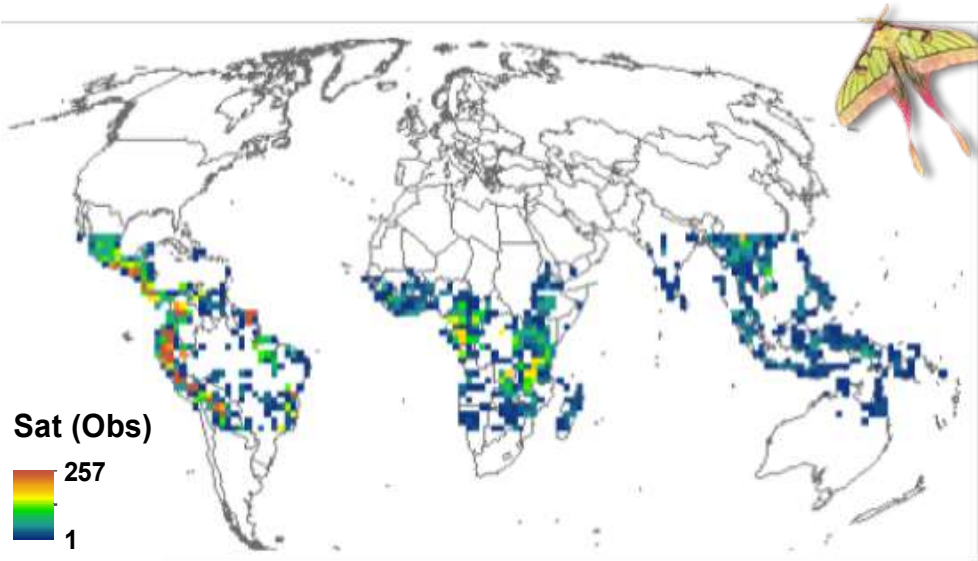

# UNDERSTANDING PATTERNS

How many species are there in the tropics and where are they?

	Saturniidae	Sphingidae
Number of records	93% (43333)	85% (22404)
Number of BINS	96% (3995)	94% (1829)

BIN = Barcode Index Number, as proxy for species

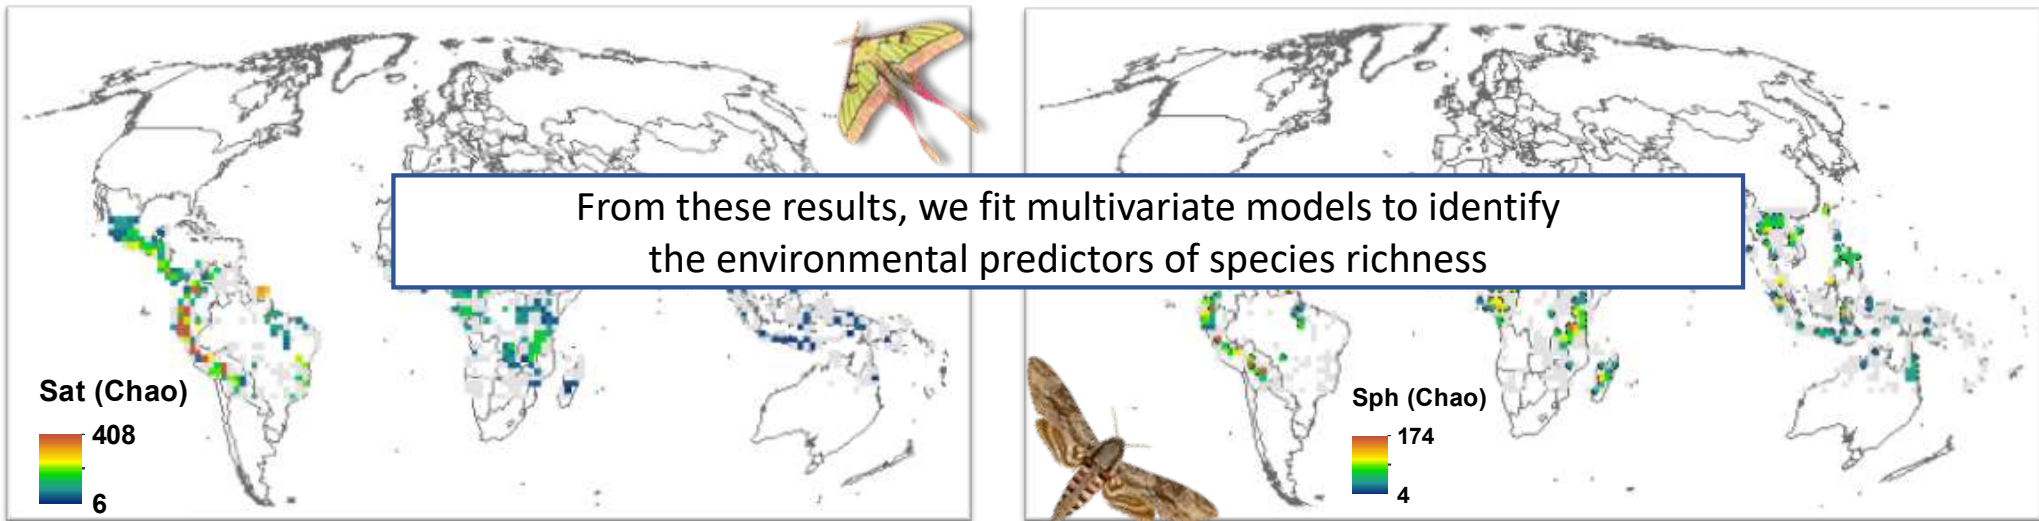

Observed richness at 200km cell-size

# UNDERSTANDING PATTERNS

Estimating species richness in the tropics

Cell size	Saturniidae (# Cells)			Sphingidae (# Cells)		
	Tropics	With data	25rec	Tropics	With data	25rec
200	1272	702	236	1272	679	147

Chao1 estimators at 200km cell-size  
Used as response variable

# UNDERSTANDING PATTERNS

**Log<sub>10</sub>S<sub>chao</sub>**  
N= 236 cells. (Pseudo-R<sup>2</sup> = 0.742)

	Coefficient	T-value	P-value
Intercept	1.053	0.105	0.000
	<b>0.058</b>	<b>0.021</b>	<b>0.007</b>
	<b>0.091</b>	<b>0.021</b>	<b>0.000</b>
	0.019	0.021	0.358
	<b>0.491</b>	<b>0.127</b>	<b>0.000</b>
	<b>0.619</b>	<b>0.165</b>	<b>0.000</b>
	<b>0.850</b>	<b>0.122</b>	<b>0.000</b>
	<b>0.282</b>	<b>0.120</b>	<b>0.020</b>

Identified as drivers of richness

**Altitudinal range:** Topographic heterogeneity

**Annual mean Precipitation :**

Precipitation variation

**Annual mean temperature:**

Temperature variation

**Tree coverage (%):** Herbivores insects

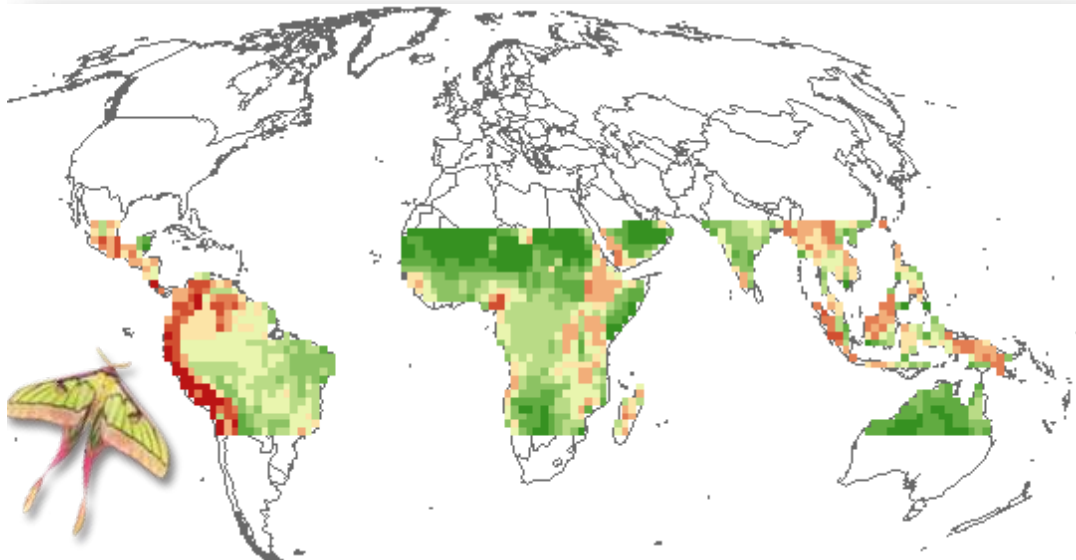

**Biogeographical regions:** Regional and historical factors

**Log<sub>10</sub>S<sub>chao</sub>**  
N= 147 cells. (Pseudo-R<sup>2</sup> = 0.45)

	Coefficient	T-value	P-value
Intercept	1.367	17.947	0.000
	<b>0.047</b>	<b>1.905</b>	<b>0.059</b>
	<b>0.059</b>	<b>2.286</b>	<b>0.024</b>

	<b>0.249</b>	<b>2.634</b>	<b>0.009</b>

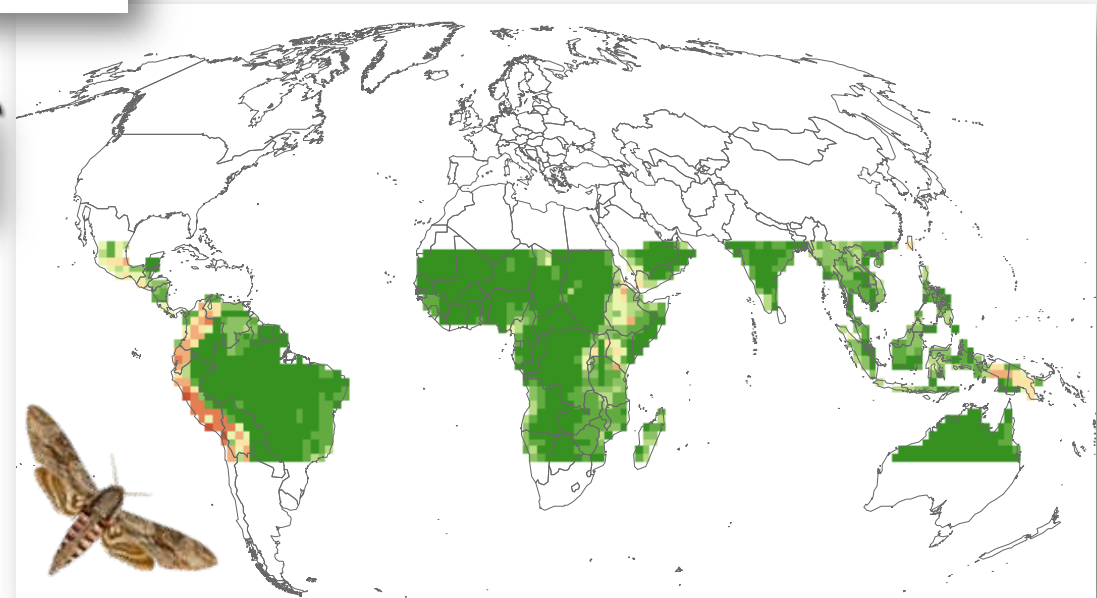

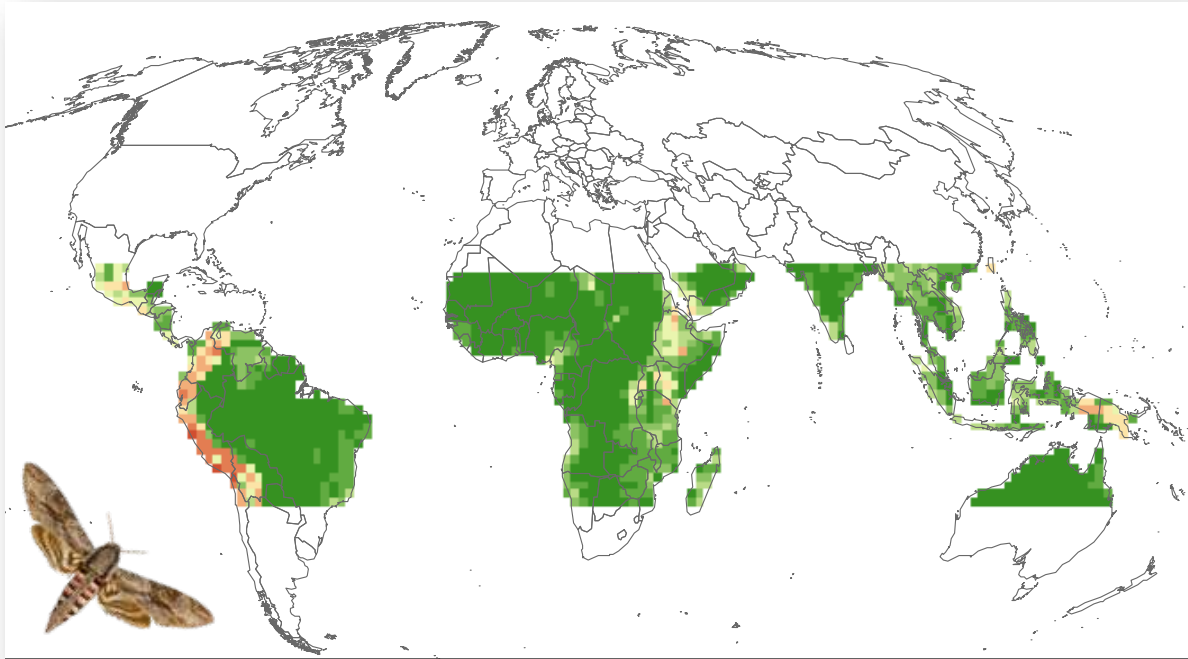

**Neotropics** as the richest for the two families. Andean part in South America, Venezuelan Amazonia, Lowland of Peru.

In the Afrotropics: East arc Mountains, Highlands of Cameroon, Forest areas of Guinea and Sierra Leone, Madagascar.

In the Asian tropics: Indo-Burma Hotspot, Sumatra, Borneo, Papua and New Guinea.

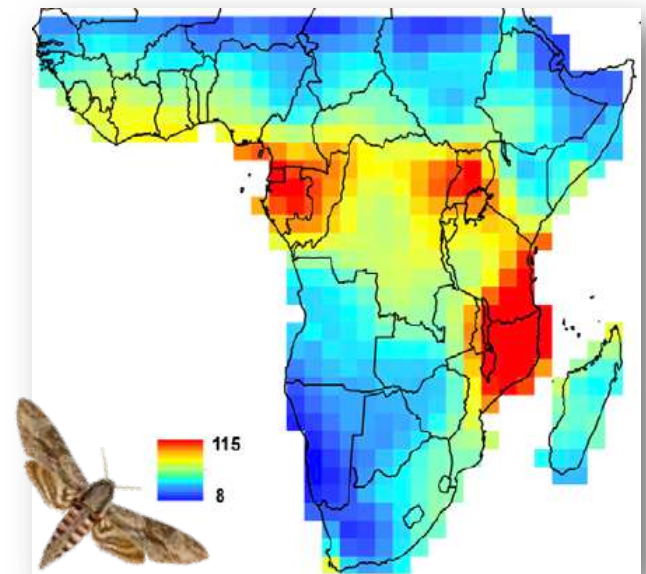

# UNDERSTANDING PATTERNS

Pearson's  $r = \underline{0.128}$   $n = 450$

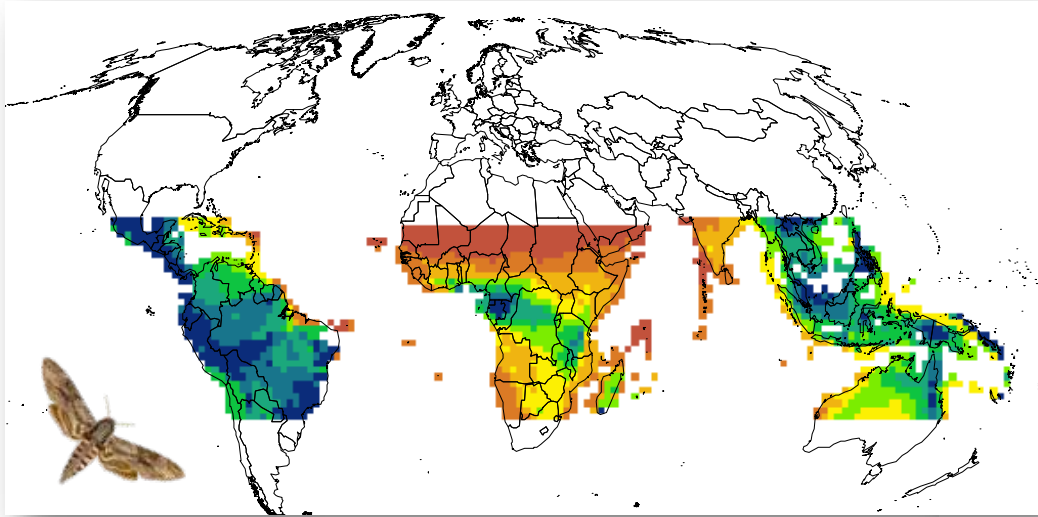

**Occurrence records.**  $S_{\text{chao25}}$   
Pseudo- $R^2 = 0.145$  ( $n=146$  cells)

Ballesteros-Mejia et al. (2013) *Glob. Ecol. & Biogeo.* 22

# UNDERSTANDING PATTERNS

Macroecological analyses: distribution of species ranges (from BINs only)

Saturniids have smaller ranges than Sphingids  
Species with narrow ranges often concentrated in  
biodiversity hotspot

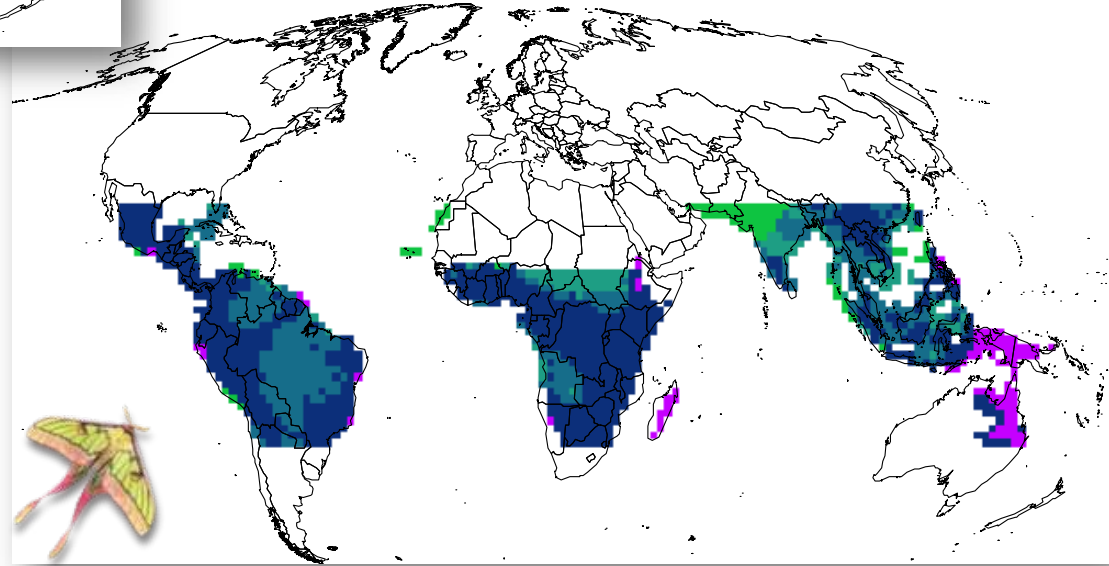

Median Geographic range area (km<sup>2</sup>)

Saturniids 2441 BINS

Sphingids 1245 BINS

Excluding singletons and doubletons

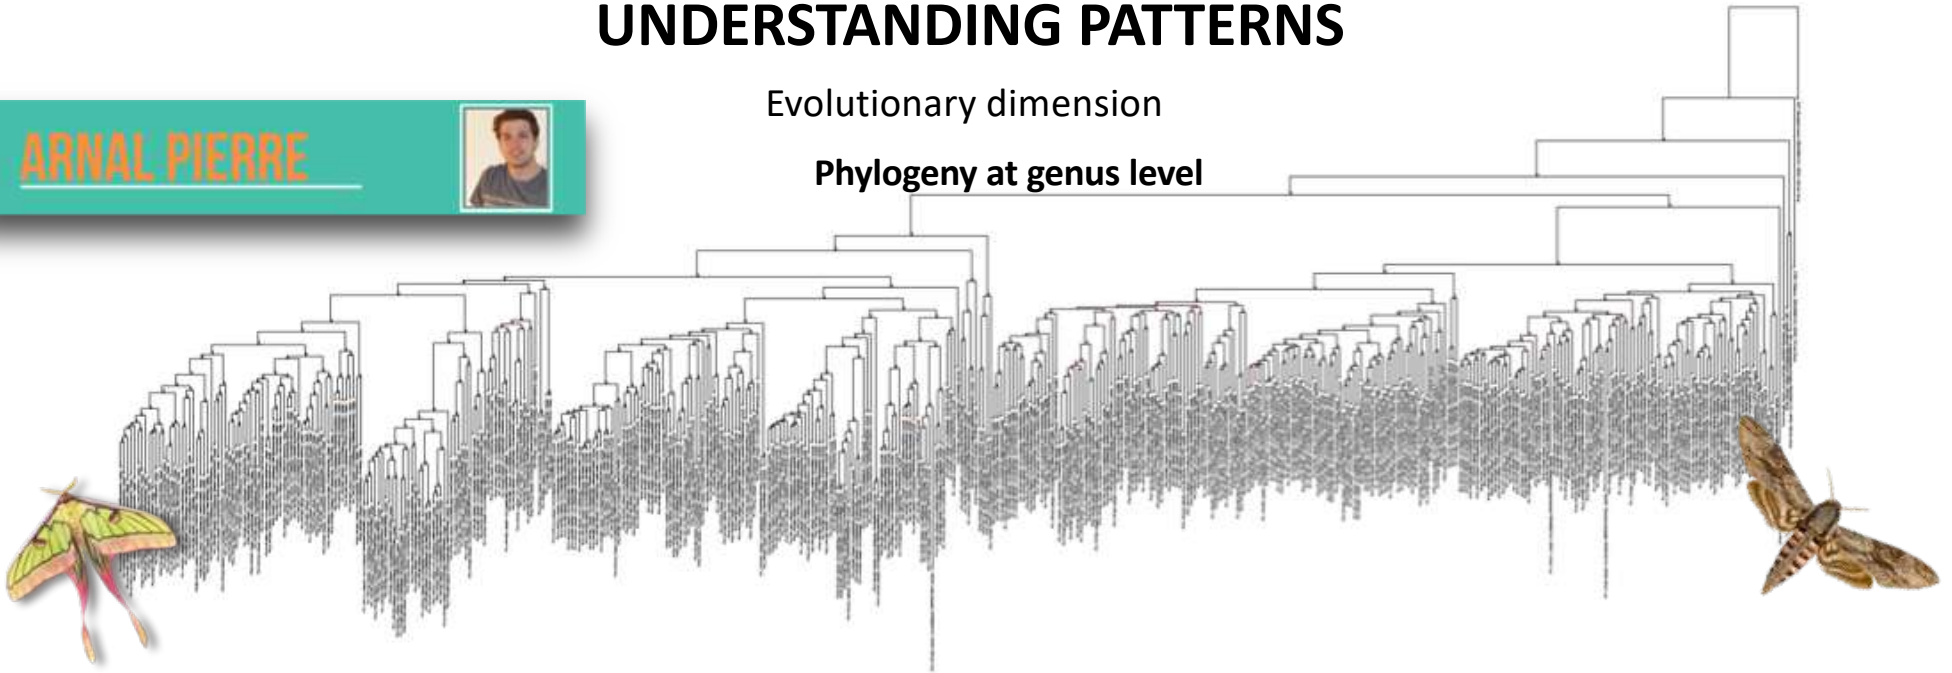

# UNDERSTANDING PATTERNS

ARNAL PIERRE

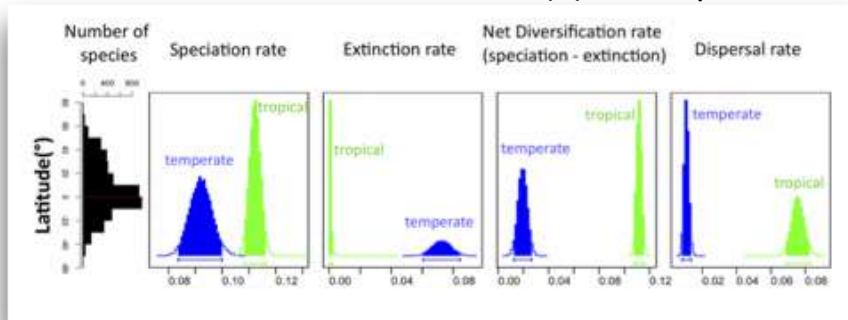

Evolutionary dimension

Phylogeny at genus level

**AIM: First and most complete phylogeny for a group of insects**

Combination of: (1) 2000 sp./1380 UCE loci dataset with (2) 5000+sp./DNA barcode dataset

- Dated phylogeny
- Diversification analysis
- Historical biogeography

# UNDERSTANDING PATTERNS

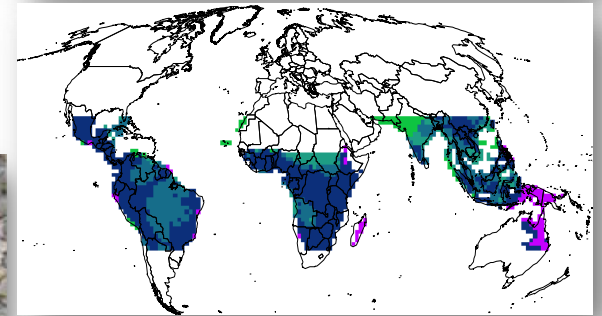

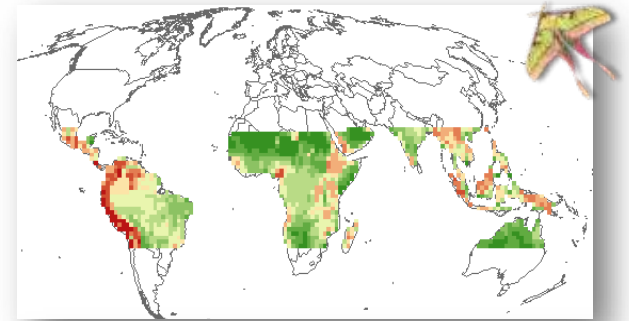

## Role of traits

... on diversification dynamics

... on diversity patterns (richness, ranges, etc.)

# UNDERSTANDING PATTERNS

## Community analyses

Responses of sphingid and saturniid moths to environmental changes

Can...

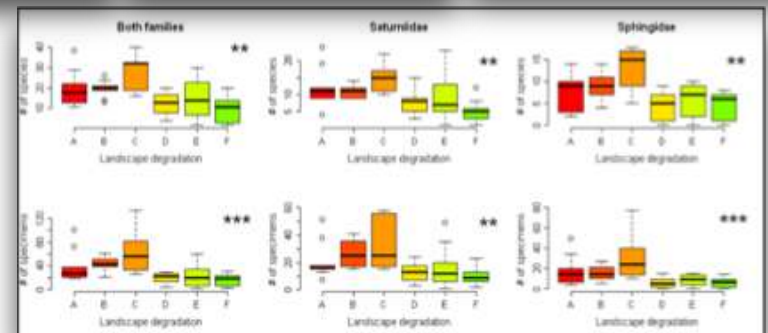

... diversification rates across lineages...

... inform how communities respond to environmental changes?

... and/or species traits...

Saturniid and sphingid moths as novel models for the study  
of insect diversity and macroecology

Population genetics

Community ecology

Life-histories & traits

# Take home messages

Fill up knowledge gaps at global scale for a group of insects

- Basic knowledge about insect diversity in space and time
- Understand, predict species responses to environmental changes
- Framework, workflow and tools made available for other groups

# Perspectives

- Comparison to other groups (vertebrates, plants, etc.)
- Conservation biology:
  - ▶ highlight areas / taxa
  - ▶ evaluate current conservation framework
  - ▶ design new conservation strategies

# ACKNOWLEDGEMENTS

All students (undergrads, master) and all contributors to the barcoding campaigns...
