

Revisiting the taxonomy of the Rattini tribe: a phylogeny-based delimitation of species boundaries

Marie Pagès, CBGP, France (CERoPath Project)

4th ICRBM, Bloemfontein (South Africa) 12th-16th April 2010

Context of the study

- Asia = center of diversification of rodents / complex community of rodents

rich community of pathogens

Biodiversity and disease risks

Global changes

biodiversity ↓ in community of hosts

changes in pathogen community

emergences of zoonoses

Risk of exposure ↑ for human, livestock and wild faunas

Necessary to understand host (rodents) and their pathogen communities = aim of the ANR project Ceropath

➔ **PREDICTION**

What does it mean?

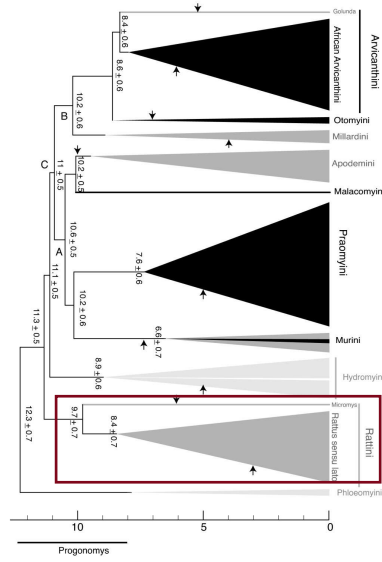

How many species in the community?

Which species are in interaction?

Specificity of the association rodent - pathogen?

Pre-requisite : to be able to recognize rodent species

Rodents in Asia = Rattini

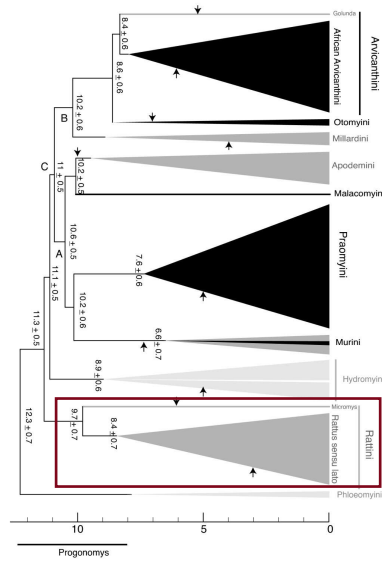

Lecompte et al., 2008

Rattini	Division	Genus	species / SEA	total species
	Crunomys division	Crunomys	0	4
		Sommeromys	0	1
	Dacnomys division	Leopoldomys	5	6
		Niviventer	7	17
		Anonymomys	0	1
		Chromomys	1	1
		Dacnomys	0	1
	Maxomys division	Maxomys	5	17
	Micromys division	Micromys	0	1
		Chiroapodemys		
		Haeromys	0	3
		Hapalomys	2	2
		Vandeleuria		
	Rattus division	Vernaya	0	1
	Rattus division	Bandicota	2	3
		Berymys	3	4
		Bunomys	0	6
		Diplathrix	0	1
		Rattus	11	66
		Sundamys	1	3
		Abditomys	0	1
		Bullimus	0	3
		Kadarsanomys	0	1
		Komodomys	0	1
		Limnomys	0	2
		Nesokia	0	2
		Nesoromys	0	1
		Palawanomys	0	1
		Papagomys	0	2

28 (Indochinese Region) / 166

Specific identification among the Rattini

high degree of similarity between sp.
high intra-specific polymorphism

Morpho. characters unsuitable for
reliable ID

Other ID tools
in need

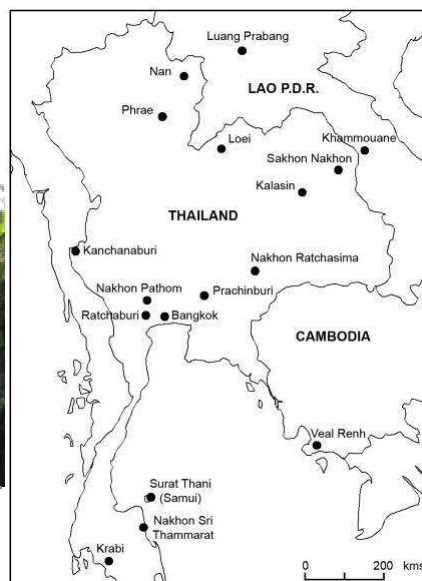

Aim

- 1/ To assess Rattini biodiversity in SEA with molecular markers
- 2/ then to design molecular ID tools

Assessing Rattini biodiversity in SE Asia with molecular tools

• Sampling area

122 specimens / 2000
trapped in the fields

Assessing Rattini biodiversity in SE Asia with molecular tools

Methods 1/ Choice of targeted genes

- efficient markers to reconstruct robust rodents phylogenies
(Jansa *et al.* 2004; Lecompte *et al.*, 2008; Rowe *et al.*, 2008; etc.)

1140 bp cytochrome *b*

670 bp Cytochrome c oxydase I

(DNA barcoding)

exon 1100-1200 bp IRBP

Assessing Rattini biodiversity in SE Asia with molecular tools

Methods 2/ Phylogenetic reconstructions

- outgroup: *Micromys minutus* (sisterships with *Rattus sensu lato* group;
Michaux *et al.*, 2007; Lecompte *et al.*, 2008; Robins *et al.*, 2008)

- model of evolution / AICc → MrAIC, Nylander, 2004

- ML reconstruction / PHYML, Guindon *et Gascuel*, 2003 on each
independent genes → no conflict

- concatenation

→ unpartitioned ML analysis: PHYML / 500 Bp resampling

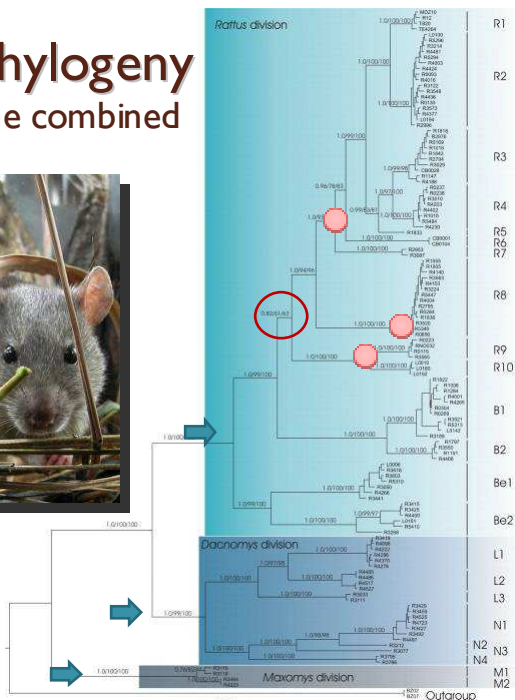

→ partitioned ML analysis : RAxML, Stamatakis, 2006

→ partitioned BA: MrBayes, Ronquist and Huelsenbeck, 2003

Dataset: 3018 bp / 122 specimens

Indochinese rat phylogeny based on the analysis of the combined dataset

But how many species?

No a priori method proposed by Pons et al., 2008

analyses of branch lengths based on the difference in branching rates at the level of species and populations.

- ✓ Branch lengths between species = speciation and extinction rates
- ✓ Branch lengths within a species = coalescence processes at the level of populations

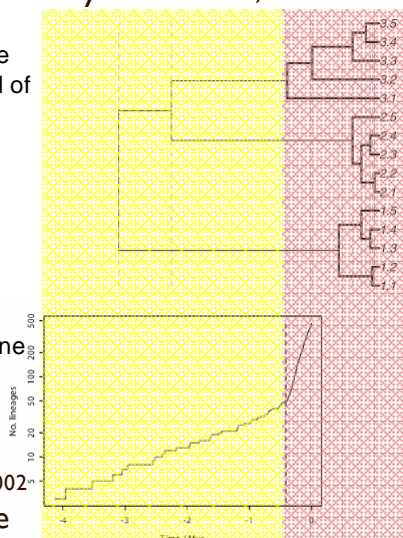

→ locations of ancestral nodes that define putative species

Prerequisite = Ultrametric tree

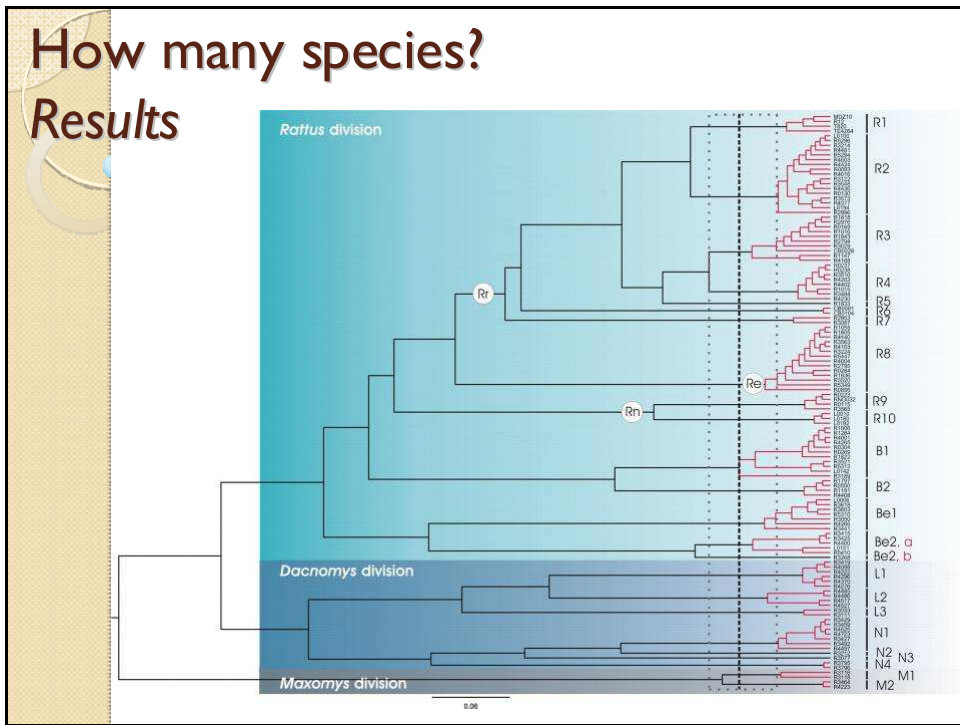

→ Multidivtime, Thorne and Kishino, 2002

→ Thanks to Pierre-Henri Fabre

How many species?

Results

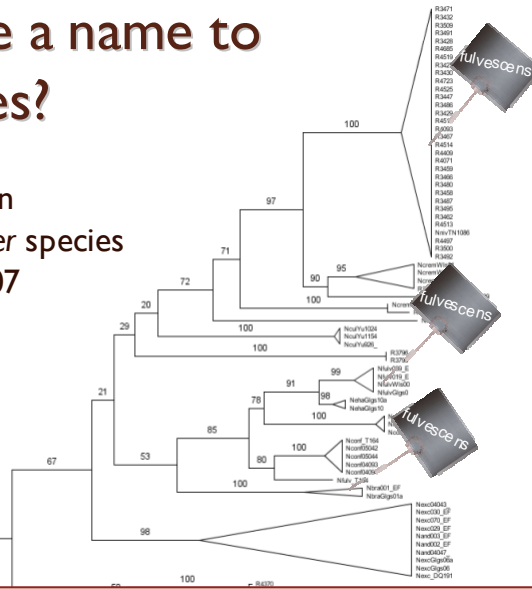

How to give a name to these species?

Using other sequences in databank
 → *Rattus* species Cytb, COI
 Robins et al., 2007

How to give a name to these species?

Using other sequences in databank → *Niviventer* species
Cytb / Jing et al., 2007

! RELIABLE MORPHO. ID OF SPECIMENS IN THE BANK?

How to give a name to these entities?

Sequencing the reference = the holotype specimen

ANCIENT DNA

degraded and chemically modified

- ✓ Very prone to contaminations by exogenous DNA
- ✓ Work in rooms dedicated to aDNA handling
- ✓ Strict manipulation protocols to authenticate results
- ✓ Small PCR targeted fragment of DNA / fragmentation

First test on Holotype

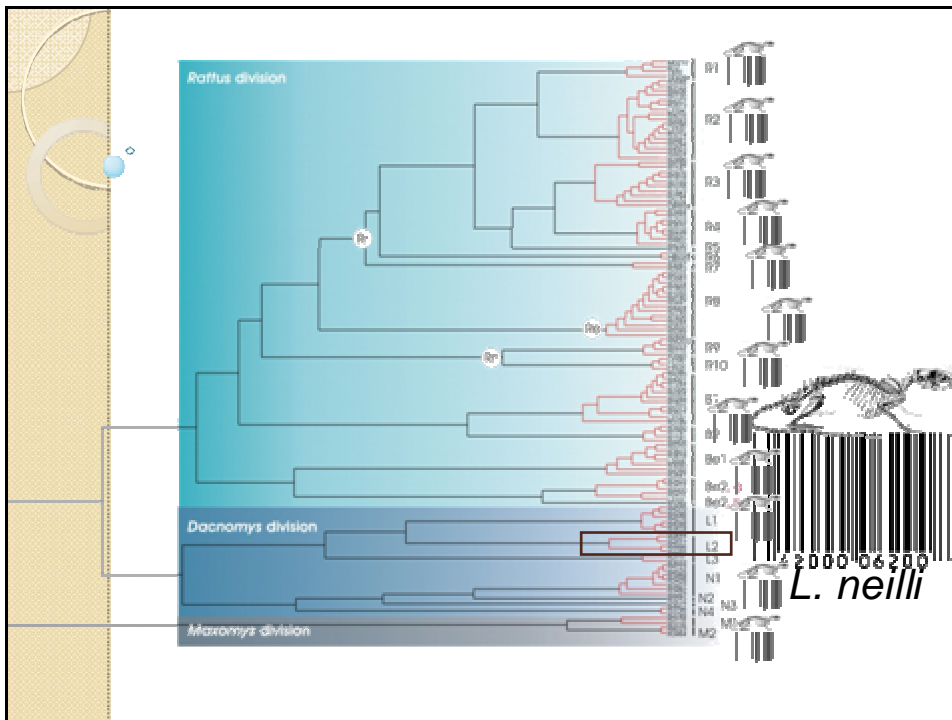

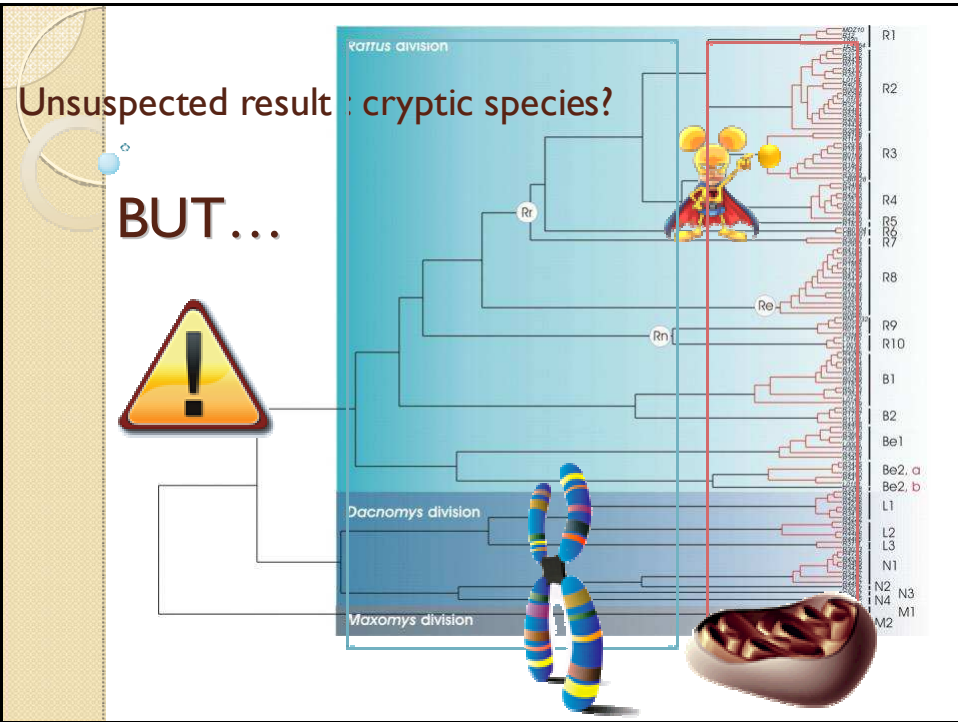

Leopoldamys neilli holotype →
PALGENE platform of palaeogenetics
(Lyon, France)

position	19	22	30	31	34	43	58	64	65	79	83

To conclude

ACURRATE SPECIES IDENTIFICATION
 Characterization of SEA rat and their pathogen communities

The collage consists of two rows of images. The top row shows five different rat species: a brown rat, a white rat, a brown rat, a white rat, and a brown rat. The bottom row shows seven images of pathogens: a yellowish larva, a brown tick, a brown flea, a red worm, a cluster of red rod-shaped bacteria, a greyish worm, and a whiteish worm.
